# 0 Introduction

This is a first class in graduate algebraic number theory. Something we'd like to do is solve diophantine equations, e.g.  $f(x_1, \ldots, x_r) \in \mathbb{Z}[x_1, \ldots, x_r]$ . In general, solving  $f(x_1, \ldots, x_r) = 0$  is very difficult. A simpler question we might consider is solving  $f(x_1, \ldots, x_r) \equiv 0 \pmod{p}$ , or  $\pmod{p^2}$ ,  $\pmod{p^3}$ , etc. Local fields package all of this information together.

#### 1 Absolute values

**Definition 1.1.** Let K be a field. An **absolute value** on K is a function  $|\cdot|: K \to \mathbb{R}_{\geq 0}$  satisfying:

- (1)  $|x| = 0 \iff x = 0$ .
- $(2) |xy| = |x||y| \forall x, y \in K.$
- (3)  $|x+y| \le |x| + |y| \ \forall x, y \in K$  (triangle inequality).

We say that  $(K, |\cdot|)$  is a **valued field**. Examples:

- Take  $K = \mathbb{Q}, \mathbb{R}, \mathbb{C}$  with the usual absolute value  $|a+ib| = \sqrt{a^2 + b^2}$ . We call this  $|\cdot|_{\infty}$ .
- For K any field, we have the trivial absolute value  $|x| = \begin{cases} 0 & \text{if } x = 0 \\ 1 & \text{else.} \end{cases}$ We will ignore this in this course.
- Take  $K = \mathbb{Q}$  and p a prime. For  $0 \neq x \in \mathbb{Q}$ , write  $x = p^n \frac{a}{b}$  where (a, p) = (b, p) = 1. Then the p-adic absolute value is defined to be

$$|x|_p = \begin{cases} 0 & x = 0\\ p^{-n} & x = p^n \frac{a}{b}. \end{cases}$$

We can check the axioms:

- (1) The first axiom is clear.
- (2)  $|xy|_p = \left| p^{n+m} \frac{ac}{bd} \right|_p = p^{-(n+m)} = |x|_p |y|_p.$
- (3) WLOG let  $m \geq n$ . Then

$$|x + y|_p = \left| p^n \left( \frac{ad + p^{m-n}bc}{bd} \right) \right|_p \le p^{-n} = \max(|x|_p, |y|_p).$$

Any absolute value  $|\cdot|$  on K induces a metric d(x,y) = |x-y| on K, hence induces a topology on K.

**Definition 1.2.** Suppose we have two absolute values  $|\cdot|, |\cdot|'$  on K. We say these absolute values are **equivalent** if they induce the same topology. An equivalence class is called a **place**.

**Proposition 1.1.** Let  $|\cdot|, |\cdot|'$  be (nontrivial) absolute values on K. Then the following are equivalent:

- (i)  $|\cdot|$  and  $|\cdot|'$  are equivalent.
- (ii)  $|x| < 1 \iff |x|' < 1 \ \forall x \in K$ .
- (iii)  $\exists c \in \mathbb{R}_{>0}$  such that  $|x|^c = |x'| \ \forall x \in K$ .

*Proof.* (i)  $\Longrightarrow$  (ii):  $|x| < 1 \iff x^n \to 0$  with respect to  $|\cdot| \iff x^n \to 0$  with respect to  $|\cdot|'$  (since the topologies are the same)  $\iff |x|' < 1$ .

(ii)  $\Longrightarrow$  (iii): Note that  $|x|^c = |x|' \iff c \log |x| = \log |x|'$ . Take  $a \in K^\times$  such that |a| > 1. This exists since  $|\cdot|$  is nontrivial. We need to show that  $\forall x \in K^\times$ ,

$$\frac{\log|x|}{\log|a|} = \frac{\log|x|'}{\log|a|'}.$$

Assume  $\frac{\log|x|}{\log|a|} < \frac{\log|x|'}{\log|a|'}$ . Choose  $m, n \in \mathbb{Z}$  such that  $\frac{\log|x|}{\log|a|} < \frac{m}{n} < \frac{\log|x|'}{\log|a|'}$ . We then have

$$\begin{cases} n\log|x| < m\log|a| \\ n\log|x|' > m\log|a|' \end{cases}$$

$$\implies \left| \frac{x^n}{a^m} \right| < 1, \left| \frac{x^n}{a^m} \right|' > 1,$$

a contradiction. The other inequality is analogous.

(iii)  $\implies$  (i): Clear, since they have the same open balls.

**Remark.**  $|\cdot|_{\infty}^2$  on  $\mathbb{C}$  is not an absolute value by our definition (doesn't satisfy the triangle inequality). Some authors replace the triangle inequality by the condition  $|x+y|^{\beta} \leq |x|^{\beta} + |y|^{\beta}$  for some fixed  $\beta \in \mathbb{R}_{>0}$ . The equivalence classes are the same in either case.

In this course, we will mainly be interested in the following:

**Definition 1.3.** An absolute value  $|\cdot|$  on K is said to be **non-archimedean** if it satisfies the **ultrametric inequality** 

$$|x+y| \le \max(|x|, |y|).$$

If  $|\cdot|$  is not non-archimedean, we say it is **archimedean**.

**Example 1.1.** •  $|\cdot|_{\infty}$  on  $\mathbb{R}$  is archimedean.

•  $|\cdot|_p$  on  $\mathbb{Q}$  is non-archimedean.

**Lemma 1.2** (All triangles are isosceles). Let  $(K, |\cdot|)$  be non-archimedean and  $x, y \in K$ . If |x| < |y|, then |x - y| = |y|.

*Proof.* On the one hand,  $|x-y| \le \max(|x|, |y|) = |y|$  (using |x| = |-x|). On the other,  $|y| \le \max(|x|, |x-y|) = |x-y|$ .

Convergence is easier in non-archimedean fields:

**Proposition 1.3.** Let  $(K, |\cdot|)$  be non-archimedean and  $(x_n)_{n=1}^{\infty}$  a sequence on K. If  $|x_n - x_{n+1}| \to 0$ , then  $(x_n)_{n=1}^{\infty}$  is Cauchy. In particular, if K is complete, then the sequence converges.

*Proof.* For  $\epsilon > 0$ , choose N such that  $|x_n - x_{n+1}| < \epsilon$  for  $n \geq N$ . Then for N < n < m,

$$|x_n - x_m| = |(x_n - x_{n+1}) + (x_{n+1} - x_{n+2}) + \dots + (x_{m-1} - x_m)| < \epsilon,$$

so  $(x_n)$  is Cauchy.

**Example 1.2.** For p = 5, we can construct a sequence in  $\mathbb{Q}$  satisfying:

- (i)  $x_n^2 + 1 \equiv 0 \pmod{5^n}$ ,
- (ii)  $x_n \equiv x_{n+1} \pmod{5^n}$ .

We construct it by induction. Take  $x_1 = 2$ . Now suppose we've constructed  $x_n$  and write  $x_n^2 + 1 = a \cdot 5^n$  and set  $x_{n+1} = x_n + b \cdot 5^n$ . We compute

$$x_{n+1}^2 + 1 = x_n^2 + 2bx_n5^n + b^25^{2n} + 1 = a5^n + 2bx_n5^n + \underbrace{b^25^{2n}}_{\equiv 0 \pmod{5^{n+1}}} + 1.$$

Hence we choose b such that  $a + 2bx_n \equiv 0 \pmod{5}$  and we're done.

Now (ii) tells us that  $(x_n)$  is Cauchy, but we claim it doesn't converge. Suppose it does,  $x_n \to l \in \mathbb{Q}$ . Then  $x_n^2 \to l^2 \in \mathbb{Q}$ . But by (i),  $x_n^2 \to -1$ , so  $l^2 = -1$ , a contradiction.

This tells us that  $(\mathbb{Q}, |\cdot|_5)$  is not complete.

**Definition 1.4.** The *p*-adic numbers  $\mathbb{Q}_p$  are the completion of  $\mathbb{Q}$  with respect to  $|\cdot|_p$ .

10 Oct 2022, Lecture 2

Let  $(K, |\cdot|)$  be a non–archimedean valued field. For  $x \in K$  and  $r \in \mathbb{R}_{>0}$ , we define  $B(x, r) = \{y \in K \mid |y - x| < r\}$  and  $\overline{B} = \{y \in K \mid |y - x| \le r\}$  to be the open and closed balls of radius r.

**Lemma 1.4.** (i) If  $z \in B(x,r)$ , then B(z,r) = B(x,r), i.e. open balls don't have centers.

- (ii) If  $z \in \overline{B}(x,r)$ , then  $\overline{B}(x,r) = \overline{B}(z,r)$ .
- (iii) B(x,r) is closed.
- (iv)  $\overline{B}(x,r)$  is open.
- *Proof.* (i) Let  $y \in B(x,r)$ . Then  $|x-y| < r \Longrightarrow |z-y| = |(z-x)+(x-y)| \le \max(|z-x|,|x-y|) < r$ , so  $B(x,r) \subset B(z,r)$ . The reverse inclusion is analogous.
- (ii) Analogous to (i) by replacing < with  $\le$ .
- (iii) Let  $y \in K \setminus B(x,r)$ . If  $z \in B(x,r) \cap B(y,r)$ , then B(x,r) = B(z,r) = B(y,r) by (i), so  $y \in B(x,r)$ , a contradiction. Hence  $B(x,r) \cap B(y,r) = \emptyset$ . Since y was arbitrary,  $K \setminus B(x,r)$  is open, so B(x,r) is closed.
- (iv) If  $z \in \overline{B}(x,r)$ , then  $B(z,r) \subset \overline{B}(z,r) \stackrel{\text{(ii)}}{=} \overline{B}(x,r)$ .

2 Valuation rings

**Definition 2.1.** Let K be a field. A valuation on K is a function  $v:K^{\times}\to\mathbb{R}$  such that

- (i) v(xy) = v(x) + v(y).
- (ii)  $v(x+y) \ge \min(v(x), v(y))$ .

Fix  $0 < \alpha < 1$ . If v is a valuation on K, then  $|x| = \begin{cases} \alpha^{v(x)} & x \neq 0 \\ 0 & x = 0 \end{cases}$  determines a non–archimedean absolute value on K. Conversely, a non–archimedean absolute

a non-archimedean absolute value on K. Conversely, a non-archimedean absolute value on K determines a valuation  $v(x) = \log_{\alpha} |x|$ .

**Remark.** We ignore the trivial evaluation  $v(x) = 0 \ \forall x \in K$ , which corresponds to the trivial absolute value.

**Definition 2.2.** We say valuations  $v_1, v_2$  are equivalent if  $\exists c \in \mathbb{R}_{>0}$  such that  $v_1(x) = cv_2(x) \ \forall x \in K^{\times}$ .

**Example 2.1.** • If  $K = \mathbb{Q}$ ,  $v_p(x) = -\log_p |x|_p$  is the *p*-adic valuation.

• Let k be a field. Let  $K=k(t)=\operatorname{Frac}(k[t])$  be a rational function field. We let

$$v\left(t^n \frac{f(t)}{g(t)}\right) = n$$

for  $f, g \in k[t], f(0) \neq 0, g(0) \neq 0$ . This is called a t-adic valuation.

• Let  $K = k((t)) = \operatorname{Frac}(k[[t]]) = \{\sum_{i=n}^{\infty} a_i t^i \mid a_i \in k, n \in \mathbb{Z}\}$ , the field of formal Laurent series over k. We define

$$v\left(\sum_{i} a_i t^i\right) = \min\{i \mid a_i \neq 0\},\,$$

the t-adic valuation on K.

**Definition 2.3.** Let  $(K, |\cdot|)$  be a non-archimedean valued field. The **valuation** ring of K is defined to be

$$\mathcal{O}_K = \{ x \in K \mid |x| \le 1 \}.$$

(i.e. the closed unit ball,  $\mathcal{O}_K = \overline{B}(0,1)$ , or  $\mathcal{O}_K = \{x \in K^\times \mid v(x) \ge 0\} \cup \{0\}$ ).

**Proposition 2.1.** (i)  $\mathcal{O}_K$  is an open subring of K.

- (ii) The subsets  $\{x \in K \mid |x| \le r\}$  and  $\{x \in K \mid |x| < r\}$  for  $r \le 1$  are open ideals in  $\mathcal{O}_K$ .
- (iii)  $\mathcal{O}_K^{\times} = \{ x \in K \mid |x| = 1 \}.$

Proof. (i) We find:

- |0| = 0 and |1| = 1, so  $0, 1 \in \mathcal{O}_K$ .
- If  $x \in \mathcal{O}_K$ , then  $|-x| = |x| \implies -x \in \mathcal{O}_K$ .
- If  $x, y \in \mathcal{O}_K$ , then  $|x + y| \le \max(|x|, |y|) \le 1$ , so  $x + y \in \mathcal{O}_K$ .
- If  $x, y \in \mathcal{O}_K$ , then  $|xy| = |x||y| \le 1$ , so  $xy \in \mathcal{O}_K$ .

Thus  $\mathcal{O}_K$  is a subring, and since  $\mathcal{O}_K = \overline{B}(0,1)$ , it is open.

- (ii) As  $r \leq 1$ ,  $\{x \in K \mid |x| \leq r\} = \overline{B}(0,r) \subset \mathcal{O}_K$ , so it is open. We find:
  - If  $x, y \in \overline{B}(0, r)$ , then  $|x + y| \le \max(|x|, |y|) \le r$ , so  $x + y \in \overline{B}_r$ .
  - If  $x \in \mathcal{O}_K, y \in \overline{B}_r$ , then  $|xy| = |x||y| \le 1 \cdot |y| \le r$ , so  $xy \in \overline{B}_r$ .

Hence this is an open ideal. The proof for  $\{x \in K \mid |x| < r\}$  is analogous.

(iii) Note that  $|x||x^{-1}|=|xx^{-1}|=1$ . Thus  $|x|=1\iff |x^{-1}|=1\iff x,x^{-1}\in\mathcal{O}_K\iff x\in\mathcal{O}_K^\times.$ 

**Notation.** Let  $\mathfrak{m} = \{x \in \mathcal{O}_K \mid |x| < 1\}$ . It turns out this is a maximal ideal in  $\mathcal{O}_K$ . Also let  $k = \mathcal{O}_K/\mathfrak{m}$ , the residue field.

Corollary 2.2.  $\mathcal{O}_K$  is a local ring (i.e. a ring with a unique maximal ideal) with unique maximal ideal  $\mathfrak{m}$ .

*Proof.* Let  $\mathfrak{m}'$  be a maximal ideal. If  $\mathfrak{m}' \neq \mathfrak{m}$ , then  $\exists x \in \mathfrak{m}' \setminus \mathfrak{m}$ . Hence |x| = 1, so by (iii) above, x is a unit, so  $\mathfrak{m}' = \mathcal{O}_K$ , a contradiction.

**Example 2.2.**  $K = \mathbb{Q}$  with  $|\cdot|_p$ . Then  $\mathcal{O}_K = \mathbb{Z}_{(p)} = \{\frac{a}{b} \in \mathbb{Q} \mid p \nmid b\}$ . In this case,  $\mathfrak{m} = p\mathbb{Z}_{(p)}$  and  $k = \mathbb{F}_p$ .

**Definition 2.4.** Let  $v: K^{\times} \to \mathbb{R}$  be a valuation. If  $v(K^{\times}) \cong \mathbb{Z}$ , then we say v is a **discrete valuation**. In this case, K is said to be a **discretely valued** field.

An element  $\pi \in \mathcal{O}_K$  is said to be a **uniformizer** if  $v(\pi) > 0$  and  $v(\pi)$  generates  $v(K^{\times})$ .

**Example 2.3.** •  $K = \mathbb{Q}$  with the p-adic valuation and K = k(t) with the t-adic valuation are discretely valued fields.

•  $K = k(t)(t^{\frac{1}{2}}, t^{\frac{1}{4}}, t^{\frac{1}{8}}, \ldots)$  with the t-adic valuation is not a discretely valued field.

**Remark.** If v is a discrete valuation, we can scale v, i.e. replace it with an equivalent valuation such that  $v(K^{\times}) = \mathbb{Z}$ . Such v are called **normalized valuations**. Then  $\pi$  is a uniformizer  $\iff v(\pi) = 1$ .

**Lemma 2.3.** Let v be a valuation on K. Then the following are equivalent:

- (i) v is discrete;
- (ii)  $\mathcal{O}_K$  is a PID;
- (iii)  $\mathcal{O}_K$  is Noetherian;
- (iv) m is principal.
- Proof. (i)  $\Longrightarrow$  (ii):  $\mathcal{O}_K \subset K$ , so  $\mathcal{O}_K$  is an integral domain. Let  $I \subset \mathcal{O}_K$  be a nonzero ideal and pick  $x \in I$  such that  $v(x) = \min\{v(a) \mid a \in I, a \neq 0\}$ , which exists as v is discrete. Then we claim that  $x\mathcal{O}_K = \{a \in \mathcal{O}_K \mid v(a) \geq v(x)\}$  is equal to I. The inclusion  $x\mathcal{O}_K \subset I$  is clear, as I is an ideal. For  $x\mathcal{O}_K \supset I$ , let  $y \in I$ , then  $v(x^{-1}y) = v(y) v(x) \geq 0 \Longrightarrow y = x(x^{-1}y) \in x\mathcal{O}_K$ .
- (ii)  $\implies$  (iii): Clear, as being a PID means every ideal is generated by one element, i.e. by finitely many.
- (iii)  $\Longrightarrow$  (iv): Write  $\mathfrak{m} = x_1 \mathcal{O}_K + \ldots + x_n \mathcal{O}_K$  and WLOG assume  $v(x_1) \leq v(x_2) \leq \ldots \leq v(x_n)$ . Then  $x_2, \ldots, x_n \in x_1 \mathcal{O}_K$ , since  $x_1 \mathcal{O}_K = \{a \in \mathcal{O}_K \mid v(a) \geq v(x_1)\}$ , so  $\mathfrak{m} = x_1 \mathcal{O}_K$ .
- (iv)  $\Longrightarrow$  (i): Let  $\mathfrak{m} = \pi \mathcal{O}_K$  for some  $\pi \in \mathcal{O}_K$  and let  $c = v(\pi)$ . Then if v(x) > 0, i.e.  $x \in \mathfrak{m}$ , then  $v(x) \geq c$ . Thus  $v(K^{\times}) \cap (0, c) = \emptyset$ . Since  $v(K^{\times})$  is a subgroup of  $(\mathbb{R}, +)$ , we have  $v(K^{\times}) = c\mathbb{Z}$ .

12 Oct 2022, Lecture 3

**Remark.** Let v be a discrete valuation on K,  $\pi \in \mathcal{O}_K$  a uniformizer. For  $x \in K^{\times}$ , let  $n \in \mathbb{Z}$  such that  $v(x) = nv(\pi)$ . Then  $u = x\pi^{-n} \in \mathcal{O}_K^{\times}$  and  $x = u\pi^n$ . In particular,  $K = \mathcal{O}_K \left[\frac{1}{\pi}\right]$  and hence  $K = \operatorname{Frac}(\mathcal{O}_K)$ .

**Definition 2.5.** A ring R is called a **discrete valuation ring** (DVR) if it is a PID with exactly one nonzero prime ideal (which is then necessarily maximal).

**Lemma 2.4.** (i) Let v be a discrete valuation on K. Then  $\mathcal{O}_K$  is a DVR.

- (ii) Let R be a DVR. Then there exists a valuation v on  $K = \operatorname{Frac}(R)$  such that  $R = \mathcal{O}_K$ .
- *Proof.* (i)  $\mathcal{O}_K$  is a PID by the previous lemma, hence any nonzero prime ideal is maximal. Since  $\mathcal{O}_K$  is a local ring, it is a DVR.
- (ii) Let R be a DVR with maximal ideal  $\mathfrak{m}$ . Then  $\mathfrak{m}=(\pi)$  for  $\pi\in R$ . Since PIDs are UFDs, we can write any nonzero  $x\in R$  uniquely as  $\pi^n u$  for some  $n\geq 0$ , u a unit (since  $\pi$  is the only prime). Then any  $y\in K^\times$  can be written uniquely as  $\pi^m u$ ,  $m\in \mathbb{Z}$ . Define  $v(\pi^m u)=m$ . We can check that this is a valuation with  $R=\mathcal{O}_K$ .

**Example 2.4.**  $\mathbb{Z}_{(p)}$ , R[[t]] for R a field are DVRs.

# 3 p-adic numbers

Recall that  $\mathbb{Q}_p$  is the completion of  $\mathbb{Q}$  with respect to  $|\cdot|_p$ . It is an exercise on example sheet 1 to show that  $\mathbb{Q}_p$  is a field. Moreover,  $|\cdot|_p$  extends to  $\mathbb{Q}_p$  and the associated valuation is discrete (example sheet again).

**Definition 3.1.** The ring of p-adic integers  $\mathbb{Z}_p$  is the valuation ring

$$\mathbb{Z}_n = \{ x \in \mathbb{Q}_n \mid |x|_n \le 1 \}.$$

**Facts.**  $\mathbb{Z}_p$  is a DVR and has a principal maximal ideal  $p\mathbb{Z}_p$ . In  $\mathbb{Z}_p$ , all nonzero ideals are given by  $p^n\mathbb{Z}_p$ .

**Proposition 3.1.**  $\mathbb{Z}_p$  is the closure of  $\mathbb{Z}$  inside  $\mathbb{Q}_p$ . In particular,  $\mathbb{Z}_p$  is the completion of  $\mathbb{Z}$  with respect to  $|\cdot|_p$ .

*Proof.* We need to show  $\mathbb{Z}$  is dense in  $\mathbb{Z}_p$ . Note  $\mathbb{Q}$  is dense in  $\mathbb{Q}_p$ . Since  $\mathbb{Z}_p \subset \mathbb{Q}_p$  is open,  $\mathbb{Z}_p \cap \mathbb{Q}$  is dense in  $\mathbb{Z}_p$ . But

$$\mathbb{Z}_p \cap \mathbb{Q} = \{ x \in \mathbb{Q} \mid |x|_p \le 1 \} = \left\{ \frac{a}{b} \in \mathbb{Q} \mid p \nmid b \right\} = \mathbb{Z}_{(p)}.$$

Thus it suffices to show that  $\mathbb{Z}$  is dense in  $\mathbb{Z}_{(p)}$ . Let  $\frac{a}{b} \in \mathbb{Z}_{(p)}$  with  $a, b \in \mathbb{Z}$  and  $p \nmid b$ . For  $n \in \mathbb{N}$ , choose  $y_n \in \mathbb{Z}$  such that  $by_n \equiv a \pmod{p^n}$ . Then  $y_n \to \frac{a}{b}$  as  $n \to \infty$ .

For the last part, note that  $\mathbb{Z}_p$  is complete (as it is a closed subset of a complete space) and  $\mathbb{Z} \subset \mathbb{Z}_p$  is dense.

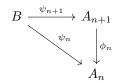

**Inverse limits.** Let  $(A_n)_{n=1}^{\infty}$  be a sequence of sets/groups/rings together with homomorphisms  $\phi_n: A_{n+1} \to A_n$  (called **transition maps**). Then the **inverse limit** of  $(A_n)_{n=1}^{\infty}$  is the set/group/ring

$$\varprojlim_{n} A_{n} = \left\{ (a_{n})_{n=1}^{\infty} \in \prod_{n=1}^{\infty} A_{n} \mid \phi_{n}(a_{n+1}) = a_{n} \ \forall n \right\}.$$

**Fact.** If  $A_n$  is a group/ring, then the inverse limit is also a group/ring. Here the group/ring operations are defined componentwise. Let  $\theta_m : \varprojlim_n A_n \to A_m$  denote the natural projection.

The inverse limit satisfies the following universal property:

**Proposition 3.2.** For any set/group/ring B together with homomorphisms  $\psi_n: B \to A_n$  such that the following diagram commutes,

there exists a unique homomorphism  $\psi: B \to \varprojlim_n A_n$  such that  $\theta_n \circ \psi = \psi_n$  for all n.

*Proof.* Define  $\psi: B \to \prod_{n=1}^{\infty} A_n$  by  $b \mapsto (\psi_n(b))_{n=1}^{\infty}$ . Then  $\psi_n = \theta_n \circ \psi_{n+1} \Longrightarrow \psi(b) \in \varprojlim_n A_n$ . This map is clearly unique (determined by  $\psi_n = \phi_n \circ \psi_{n+1}$ ), and is a homomorphism of sets/groups/rings.

**Definition 3.2.** Let  $I \subset R$  be an ideal (in a ring R). The I-adic completion of R is the ring  $\hat{R} = \varprojlim_n R/I^n$  where  $R/I^{n+1} \to R/I^n$  is the natural projection.

Note that there exists a natural map  $i: R \to \hat{R}$  by the universal property (since there exist maps  $R \to R/I^n$ ).

**Definition 3.3.** We say R is I-adically complete if i is an isomorphism.

**Fact.** 
$$\ker(i:R\to\hat{R})=\bigcap_{n=1}^{\infty}I^n$$
 (check!).

Let  $(K, |\cdot|)$  be a non-archimedean valued field and  $\pi \in \mathcal{O}_K$  such that  $|\pi| < 1$ .

**Proposition 3.3.** Assume K is complete with respect to  $|\cdot|$ . Then:

- (i)  $\mathcal{O}_K \stackrel{i}{\cong} \varprojlim_n \mathcal{O}_K / \pi^n \mathcal{O}_K$  (i.e.  $\mathcal{O}_K$  is  $\pi$ -adically complete)<sup>1</sup>.
- (ii) Every  $x \in \mathcal{O}_K$  can be written uniquely as  $x = \sum_{i=0}^{\infty} a_i \pi^i$  with  $a_i \in A$ , where  $A \subset \mathcal{O}_K$  is a set of coset representatives for  $\mathcal{O}_K/\pi\mathcal{O}_K$ . Moreover, any such power series converges (in  $\mathcal{O}_K$ ).
- *Proof.* (i) K is complete and  $\mathcal{O}_K \subset K$  is closed, so  $\mathcal{O}_K$  is complete. If  $x \in \bigcap_{n=1}^{\infty} \pi^n \mathcal{O}_K$ , then  $v(x) \geq nv(\pi) \ \forall n \implies x = 0$ , hence the natural map  $\mathcal{O}_K \to \varprojlim_n \mathcal{O}_K / \pi^n \mathcal{O}_K$  is injective.

For surjectivity, let  $(x_n)_{n=1}^{\infty} \in \varprojlim_{n} \mathcal{O}_K / \pi^n \mathcal{O}_K$  and for each n, let  $y_n \in \mathcal{O}_K$  be a lifting of  $x_n \in \mathcal{O}_K / \pi^n \mathcal{O}_K$ . Then  $y_n - y_{n+1} \in \pi^n \mathcal{O}_K$ , thus  $(y_n)_{n=1}^{\infty}$  is a Cauchy sequence in  $\mathcal{O}_K$ . Let  $y_n \to y \in \mathcal{O}_K$ . Then y maps to  $(x_n)_{n=1}^{\infty}$  in  $\varprojlim_{n} \mathcal{O}_K / \pi^n \mathcal{O}_K$ .

(ii) Left as exercise on example sheet 1.

Corollary 3.4. (i)  $\mathbb{Z}_p \cong \varprojlim_n \mathbb{Z}/p^n \mathbb{Z}$ .

(ii) Every element in  $\mathbb{Q}_p$  can be written uniquely as  $x = \sum_{i=n}^{\infty} a_i p^i$  where we have  $a_i \in \{0, 1, \dots, p-1\}$ .

14 Oct 2022, Lecture 4

*Proof.* (i) By the previous proposition we just need to show  $\mathbb{Z}/p^n\mathbb{Z} \cong \mathbb{Z}_p/p^n\mathbb{Z}_p$ . Let  $f_n: \mathbb{Z} \to \mathbb{Z}_p/p^n\mathbb{Z}_p$  be the natural map. Then

$$\ker(f_n) = \{x \in \mathbb{Z} \mid |x|_p \le p^{-n}\} = p^n \mathbb{Z},$$

thus the natural map  $\mathbb{Z}/p^n\mathbb{Z} \to \mathbb{Z}_p/p^n\mathbb{Z}_p$  is injective.

For surjectivity, take  $\overline{z} \in \mathbb{Z}_p/p^n\mathbb{Z}_p$  and  $c \in \mathbb{Z}_p$  a lift. Since  $\mathbb{Z}$  is dense in  $\mathbb{Z}_p$ , there exists  $x \in \mathbb{Z}$  such that  $x \in c + p^n\mathbb{Z}_p$  ( $p^n\mathbb{Z}_p$  is open in  $\mathbb{Z}_p$ ). Then  $f_n(x) = \overline{z}$ , so  $\mathbb{Z}/p^n\mathbb{Z} \to \mathbb{Z}_p/p^n\mathbb{Z}_p$  is surjective.

(ii) Follows from Corollary 3.4 (ii) applied to  $p^{-n}x \in \mathbb{Z}_p$  for some  $n \in \mathbb{Z}$ .

**Example 3.1.** We have  $\frac{1}{1-p} = 1 + p + p^2 + p^3 + \dots$  in  $\mathbb{Q}_p$ .

<sup>1</sup>There a bit of abuse of notation here – really,  $\mathcal{O}_K$  is  $(\pi)$ -adically complete.

<sup>&</sup>lt;sup>2</sup>Given a surjective map  $G \to G'$ , a lift of an element  $x \in G'$  is a choice of  $y \in G$  such that  $y \mapsto x$  under this map.

### 4 Complete valued fields

#### 4.1 Hensel's lemma

**Theorem 4.1** (Hensel's lemma, version 1). Let  $(K, |\cdot|)$  be a complete discretely valued field. Let  $f(x) \in \mathcal{O}_K[x]$  and assume  $\exists a \in \mathcal{O}_K$  such that  $|f(a)| < |f'(a)|^2$  for f'(a) the formal derivative. Then there exists a unique  $x \in \mathcal{O}_K$  such that f(x) = 0 and |x - a| < |f'(a)|.

*Proof.* Let  $\pi \in \mathcal{O}_K$  be a uniformizer and let r = v(f'(a)) for v a normalized valuation, i.e.  $v(\pi) = 1$ . We inductively construct a sequence  $(x_n)$  in  $\mathcal{O}_K$  such that

- (i)  $f(x_n) \equiv 0 \pmod{\pi^{n+2r}}$ .
- (ii)  $x_{n+1} \equiv x_n \pmod{\pi^{n+r}}$ .

Take  $x_1 = a$ , so  $f(x_1) \equiv 0 \pmod{\pi^{1+2r}}$ . Now suppose we've constructed  $x_1, \ldots, x_n$  satisfying the conditions. Then define  $x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$ . Since  $x_n \equiv x_1 \pmod{\pi^{r+1}}$ ,  $v(f'(x_n)) = v(f'(x_1)) = r$  and hence  $\frac{f(x_n)}{f'(x_n)} \equiv 0 \pmod{\pi^{n+r}}$  by (i). It follows that  $x_{n+1} \equiv x_n \pmod{\pi^{n+r}}$ , so (ii) holds.

Note that for X,Y indeterminates, we can write  $f(X+Y)=f_0(X)+f_1(X)Y+f_2(X)Y^2+\ldots$ , where  $f_i\in\mathcal{O}_K[X]$  and  $f_0(X)=f(X),f_1(X)=f'(X)$ . Thus  $f(x_{n+1})=f(x_n)+f'(x_n)c+f_2(x_n)c^2+\ldots$  for  $c=-\frac{f(x_n)}{f'(x_n)}$ . Since  $c\equiv 0\pmod{\pi^{n+r}}$  and  $v(f_i(x_n))\geq 0$ , we have  $f(x_{n+1})\equiv f(x_n)+cf'(x_n)\pmod{\pi^{n+2r+1}}$  (since the other terms vanish), but this is  $\equiv 0\pmod{\pi^{n+2r+1}}$ , so (i) holds.

This gives the construction of  $(x_n)$ . Property (ii) implies that  $(x_n)$  is Cauchy, so let  $x \in \mathcal{O}_K$  be the limit,  $x_n \to x$ . Then  $f(x) = \lim_{n \to \infty} f(x_n) = 0$  by property (i). Moreover, (ii) implies  $a = x_1 \equiv x_n \pmod{\pi^{r+1}}$   $\forall n$ , so  $a \equiv x \pmod{\pi^{r+1}}$ , thus |x - a| < |f'(a)|.

For uniqueness, suppose x' also satisfies f(x') = 0 and |x' - a| < |f'(a)|. Set  $\delta = x' - x \neq 0$ . Then |x' - a| < |f'(a)| and |x - a| < |f'(a)|, so the ultrametric inequality implies  $|\delta| = |x' - x| < |f'(a)| = |f'(x)|$  (since  $a \equiv x \pmod{\pi^{r+1}}$ ). But

$$0 = f(x') = f(x+\delta) = \underbrace{f(x)}_{=0} + f'(x)\delta + \underbrace{\delta^2 \dots}_{|\cdot| \le |\delta|^2}.$$

Hence  $|f'(x)\delta| \leq |\delta|^2 \implies |f'(x)| \leq |\delta|$ , a contradiction.

**Corollary 4.2.** Let  $(K, |\cdot|)$  be a complete discretely valued field, let  $f(x) \in \mathcal{O}_K[x]$  and let  $\overline{c} \in k = \mathcal{O}_K/\mathfrak{m}$  be a simple root of  $\overline{f}(x) = f(x) \pmod{\mathfrak{m}} \in k[x]$ . Then there exists a unique  $x \in \mathcal{O}_K$  such that f(x) = 0 and  $x \equiv \overline{c} \pmod{\mathfrak{m}}$ .

*Proof.* Apply Hensel's lemma to a lift  $c \in \mathcal{O}_K$  of  $\overline{c}$ . Then  $|f(c)| < 1 = |f'(c)|^2$  since f'(c) is a simple root.

**Example 4.1.** Consider  $f(x) = x^2 - 2$ , which has a simple root mod 7. Thus  $\sqrt{2} \in \mathbb{Z}_7 \subset \mathbb{Q}_7$ .

Corollary 4.3. 
$$\mathbb{Q}_p^{\times}/(\mathbb{Q}_p^{\times})^2 \cong \begin{cases} (\mathbb{Z}/2\mathbb{Z})^2 & \text{if } p > 2. \\ (\mathbb{Z}/2\mathbb{Z})^3 & \text{if } p = 2. \end{cases}$$

*Proof.* First consider p > 2. Let  $b \in \mathbb{Z}_p^{\times}$ . Applying the previous corollary to  $f(x) = x^2 - b$ , we find that  $b \in (\mathbb{Z}_p^{\times})^2$  if and only if  $b \in (\mathbb{F}_p^{\times})^2$ . Thus  $\mathbb{Z}_p^{\times} \to \mathbb{F}_p^{\times}/(\mathbb{F}_p^{\times})^2$  has kernel  $(\mathbb{Z}_p^{\times})^2$ , so induces an isomorphism  $\mathbb{Z}_p^{\times}/(\mathbb{Z}_p^{\times})^2 \to \mathbb{F}_p^{\times}/(\mathbb{F}_p^{\times})^2 \cong (\mathbb{Z}/2\mathbb{Z})$  (since  $\mathbb{F}_p^{\times} = \mathbb{Z}/(p-1)\mathbb{Z}$ ).

We have an isomorphism  $\mathbb{Z}_p^{\times} \times \mathbb{Z} \to \mathbb{Q}_p^{\times}$  given by  $(u, n) \mapsto up^n$ . Then  $\mathbb{Q}_p^{\times}/(\mathbb{Q}_p^{\times})^2 \cong (\mathbb{Z}/2\mathbb{Z})^2$ .

If p=2, let  $b\in\mathbb{Z}_2^{\times}$ . Consider  $f(x)=x^2-b$ , so  $f'(x)=2x\equiv 0\pmod 2$ . Instead now let  $b\equiv 1\pmod 8$ . Then  $|f(1)|_2\leq 2^{-3}<2^{-2}=|f'(1)|_2^2$ . Hensel's lemma now implies that  $b\in(\mathbb{Z}_2^{\times})^2\iff b\equiv 1\pmod 8$ . Thus  $\mathbb{Z}_2^{\times}/(\mathbb{Z}_2^{\times})^2\cong(\mathbb{Z}/8\mathbb{Z})^{\times}=(\mathbb{Z}/2\mathbb{Z})^2$ . Again using  $\mathbb{Q}_2^{\times}\cong\mathbb{Z}_2^{\times}\times\mathbb{Z}$ , we obtain that  $\mathbb{Q}_2^{\times}/(\mathbb{Q}_2^{\times})^2\cong(\mathbb{Z}/2\mathbb{Z})^3$ .

**Remark.** The proof of Hensel's lemma uses the iteration  $x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$ . We can think of the proof as the non-archimedean analogue of the Newton-Raphson method.

**Theorem 4.4** (Hensel's lemma, version 2). Let  $(K, |\cdot|)$  be a complete discretely valued field and  $f(x) \in \mathcal{O}_K[x]$ . Suppose  $\overline{f}(x) = f(x) \pmod{\mathfrak{m}} \in k[x]$  factorizes as  $\overline{f}(x) = \overline{g}(x)\overline{h}(x) \in k[x]$  with  $\overline{g}(x), \overline{h}(x)$  coprime. Then there is a factorization f(x) = g(x)h(x) in  $\mathcal{O}_K[x]$  with  $\overline{g}(x) \equiv g(x) \pmod{\mathfrak{m}}$ ,  $\overline{f}(x) \equiv f(x) \pmod{\mathfrak{m}}$  and  $\deg(\overline{g}) = \deg(g)$ .

*Proof.* Left as an exercise on example sheet 1.

17 Oct 2022, Lecture 5

Corollary 4.5. Let  $f(x) = a_n x^n + \ldots + a_0 \in k[x]$  with  $a_0 \ldots a_n \neq 0$ . If f(x) is irreducible, then  $|a_i| \leq \max(|a_0|, |a_n|)$  for all i.

*Proof.* By scaling, assume  $f(x) \in \mathcal{O}_K[x]$  with  $\max(|a_i|) = 1$ . Then we need to show that  $\max(|a_0|, |a_n|) = 1$ . If not, let r be minimal such that  $|a_r| = 1$ , so 0 < r < n. Then

$$\overline{f}(x) = x^r (a_r + \dots a_n x^{n-r}) \pmod{\mathfrak{m}}.$$

By Hensel's lemma version 2, f(x) = g(x)h(x) with  $\deg(g) = r$ , contradicting irreducibility.

### 5 Teichmüller lifts

**Definition 5.1.** A ring R of characteristic p > 0 is **perfect** if the Frobenius map  $x \mapsto x^p$  is a bijection.

A field of characteristic p is **perfect** if it is perfect as a ring.

**Remark.** Since char R = p,  $(x + y)^p = x^p + y^p$ , so the Frobenius map is a ring homomorphism.

**Example 5.1.** (i)  $\mathbb{F}_{p^n}$  is perfect and  $\overline{\mathbb{F}_p}$  is perfect.

- (ii) Non-example.  $\mathbb{F}_p[t]$  is not perfect since  $t \notin \text{Im}(\text{Frob})$ .
- (iii)  $\mathbb{F}_p(t^{\frac{1}{p^{\infty}}}) = \mathbb{F}_p\left(t, t^{\frac{1}{p}}, t^{\frac{1}{p^2}}, \ldots\right)$  is a perfect field, known as the **perfection** of  $\mathbb{F}_p(t)$ .

**Fact.** A field k of characteristic p > 0 is perfect if and only if any finite extension of k is separable.

**Theorem 5.1.** Let  $(K, |\cdot|)$  be a complete discretely valued field such that the residue field  $k = \mathcal{O}_K/\mathfrak{m}$  is a perfect field of characteristic p > 0. Then there exists a unique map  $[]: k \to \mathcal{O}_K$  such that

- (i)  $a \equiv [a] \pmod{\mathfrak{m}} \ \forall a \in k$ ,
- (ii)  $[ab] = [a][b] \ \forall a, b \in k$ .

Moreover, if char  $\mathcal{O}_K = p$ , then [] is a ring homomorphism (i.e. it also preserves addition).

**Definition 5.2.** The element  $[a] \in \mathcal{O}_K$  is called the **Teichmüller lift** of a.

**Lemma 5.2.** Let  $(K, |\cdot|)$  be a complete discretely valued field<sup>3</sup> and fix  $\pi \in \mathcal{O}_K$  a uniformizer. Let  $x, y \in \mathcal{O}_K$  be such that  $x \equiv y \pmod{\pi^k}$  for  $k \geq 1$ . Then  $x^p \equiv y^p \pmod{\pi^{k+1}}$ .

*Proof.* Let  $x = y + u \cdot \pi^k$  for some  $u \in \mathcal{O}_K$ . Then

$$x^{p} = \sum_{i=0}^{p} \binom{p}{i} y^{p-i} (u\pi^{k})^{i} = y^{p} + \sum_{i=1}^{p} \binom{p}{i} y^{p-i} (u\pi^{k})^{i}.$$

Since char  $\mathcal{O}_K/\pi\mathcal{O}_K=p$ , we have  $p\in\pi\mathcal{O}_K$ . Thus  $\binom{p}{i}y^{p-i}(u\pi^k)^i\in\pi^{k+1}\mathcal{O}_K\ \forall i\geq 1$ , so  $x^p\equiv y^p\pmod{\pi^{k+1}}$ .

 $<sup>^3(\</sup>text{do we need the residue field to be perfect here? lectures said let }(K,|\cdot|)$  be as in above theorem).

Proof of Theorem 5.1. Let  $a \in k$ . For each i > 0, we choose a lift  $y_i \in \mathcal{O}_K$  of  $a^{\frac{1}{p^i}}$  and define  $x_i = y_i^{p^i}$ . We claim that  $(x_i)$  is a Cauchy sequence and its limit  $x_i \to x$  is independent of the choice of  $y_i$ .

By construction,  $y_i \equiv y_{i+1}^p \pmod{\pi}$ . By our previous lemma and induction on k, we have that  $y_i^{p^k} \equiv y_{i+1}^{p^{k+1}} \pmod{\pi^{k+1}}$  and hence  $x_i \equiv x_{i+1} \pmod{\pi^{i+1}}$  (by taking k=i) and hence  $(x_i)$  is Cauchy, so  $x_i \to x \in \mathcal{O}_K$ .

Suppose  $(x_i')$  arises from another choice of  $y_i'$  lifting  $a_i^{\frac{1}{p^i}}$ . Then  $(x_i')$  is Cauchy and  $x_i' \to x'$ . Let

$$x'' = \begin{cases} x_i & i \text{ even.} \\ x_i' & i \text{ odd.} \end{cases}$$

Then  $x_i''$  arises from the lifting  $y'' = \begin{cases} y_i & i \text{ even.} \\ y_i' & i \text{ odd.} \end{cases}$ . Then  $x_i''$  is Cauchy with subsequences converging to both x and x', so x = x', so our limit is independent of the choice of liftings  $(y_i)$ . We define [a] = x. Then  $x_i \equiv y_i^{p^i} \equiv \left(a^{\frac{1}{p^i}}\right)^{p^i} \equiv a \pmod{\pi}$ , so  $x \equiv a \pmod{\pi}$ , giving us the first property.

Now let  $b \in k$  and choose  $u_i \in \mathcal{O}_K$  a lift of  $b^{\frac{1}{p^i}}$  and let  $z_i = u_i^{p^i}$ . Then  $[b] = \lim_{i \to \infty} z_i$ . Now  $u_i y_i$  is a lift of  $(ab)^{\frac{1}{p^i}}$ , hence

$$[ab] = \lim_{i \to \infty} (u_i y_i)^{p^i} = \lim_{i \to \infty} x_i z_i = \lim_{i \to \infty} x_i \lim_{i \to \infty} z_i = [a][b],$$

giving us the second property.

If char K=p, then  $u_i+y_i$  is a lift of  $a^{\frac{1}{p^i}}+b^{\frac{1}{p^i}}=(a+b)^{\frac{1}{p^i}}.$  Then

$$[a+b] = \lim_{i \to \infty} (y_i + u_i)^{p^i} = \lim_{i \to \infty} y_i^{p^i} + u_i^{p_i} = \lim_{i \to \infty} x_i + z_i = [a] + [b].$$

Finally, it is easy to check that [0] = 0 and [1] = 1 (take  $y_i = 0$  and  $y_i = 1$ ). So [] is a ring homomorphism.

For uniqueness, let  $\phi: K \to \mathcal{O}_K$  be another map of the desired form. Then for  $a \in k$ ,  $\phi\left(a^{\frac{1}{p^i}}\right)$  is a lift of  $a^{\frac{1}{p^i}}$ . It follows that

$$[a] = \lim_{i \to \infty} \phi \left( a^{\frac{1}{p^i}} \right)^{p^i} = \lim_{i \to \infty} \phi(a) = \phi(a).$$

**Example 5.2.** For  $K = \mathbb{Q}_p$ , what does  $[]: \mathbb{F}_p \to \mathbb{Z}_p$  look like? Take  $a \in \mathbb{F}_p^{\times}$ , so  $[a]^{p-1} = [a^{p-1}] = [1] = 1$ . Hence [a] is a  $(p-1)^{\text{th}}$  root of unity.

More generally:

**Lemma 5.3.** Let  $(K, |\cdot|)$  be a complete discretely valued field. If  $k = \mathcal{O}_K/\mathfrak{m} \subset \overline{\mathbb{F}_p}$  (which implies that k is perfect), then  $[a] \in \mathcal{O}_K$  is a root of unity  $\forall a \in k^{\times}$ .

*Proof.* 
$$a \in k^{\times} \implies a \in \mathbb{F}_{p^n}$$
 for some  $n \implies [a]^{p^n-1} = [a^{p^n-1}] = [1] = 1$ .

**Theorem 5.4.** Let  $(K, |\cdot|)$  be a complete discretely valued field of characteristic p > 0. Assume  $k = \mathcal{O}_K/\mathfrak{m}$  is perfect. Then  $K \cong k((t))$ .

*Proof.* Since  $K = \operatorname{Frac}(\mathcal{O}_K)$ , it suffices to show that  $\mathcal{O}_K \cong k[[t]]$ . For this, fix  $\pi \in \mathcal{O}_K$  a uniformizer and let  $[:k \to \mathcal{O}_K]$  be the Teichmüller map. Define  $\phi: k[[t]] \to \mathcal{O}_K$  by  $\phi\left(\sum_{i=0}^{\infty} a_i t^i\right) = \sum_{i=0}^{\infty} a_i \pi^i$ . Then  $\phi$  is a ring homomorphism since [:] is a ring homomorphism, but it is also a bijection by Proposition 3.3.  $\square$ 

## 6 Extensions of complete valued fields

19 Oct 2022, Lecture 6

**Theorem 6.1.** Let  $(K, |\cdot|)$  be a complete discretely valued field and let L/K be a finite extension of degree n. Then:

(i)  $|\cdot|$  extends uniquely to an absolute value  $|\cdot|_L$  on L defined by

$$|y|_L = |N_{L/K}(y)|^{1/n}.$$

(ii) L is complete with respect to  $|\cdot|_L$ .

**Recall.** If L/K is a finite extension, then  $N_{L/K}: L \to K$  is defined by  $N_{L/K}(y) = \det_K(\operatorname{mult}(y))$  where  $\operatorname{mult}(y): L \to L$  is the K-linear map given by multiplication by y.

#### Facts:

- The norm is multiplicative, i.e.  $N_{L/K}(xy) = N_{L/K}(x)N_{L/K}(y)$ .
- Let  $X^n + a_{n-1}X^{n-1} + \ldots + a_0 \in K[X]$  be the minimal polynomial of  $y \in L$ . Then  $N_{L/K}(y) = \pm a_0^m$  for some  $m \ge 1$ . In particular,  $N_{L/K}(x) = 0 \iff x = 0$ .

**Definition 6.1.** Let  $(K, |\cdot|)$  be a nonarchimedean valued field and V a vector spec over K. Then a **norm** on V is a function  $||\cdot||: V \to \mathbb{R}_{\geq 0}$  satisfying

- $||x|| = 0 \iff x = 0.$
- $||\lambda x|| = |\lambda| \cdot ||x|| \ \forall x \in V, \lambda \in K.$
- $||x + y|| \le \max(||x||, ||y||) \ \forall x, y \in V.$

**Example 6.1.** If V is finite-dimensional and  $e_1, \ldots, e_n$  is a basis for V, then the **sup norm**  $||\cdot||_{\sup}$  on V is defined by  $||x||_{\sup} = \max_i |x_i|$ , where  $x = \sum_{i=1}^n x_i e_i$ .

**Exercise**:  $||\cdot||_{\text{sup}}$  is a norm.

**Definition 6.2.** Two norms  $||\cdot||_1, ||\cdot||_2$  on V are **equivalent** if there exist constants  $C, D \in \mathbb{R}_{>0}$  such that

$$C||x||_1 \le ||x||_2 \le D||x||_1 \ \forall x \in V.$$

**Fact.** A norm defines a topology on V and equivalent norms induce the same topology (since an open ball in one topology is both contained in and contains an open ball in the other topology).

**Proposition 6.2.** Let  $(K, |\cdot|)$  be complete and nonarchimedean and let V be a finite dimensional vector space over K. Then V is complete with respect to  $||\cdot||_{\sup}$ .

*Proof.* Let  $(v_i)$  be a Cauchy sequence in V and let  $e_1, \ldots, e_n$  be a basis for V. Write  $V_i = \sum_{j=1}^n x_j^i e_j$ , then  $(x_j^i)_{i=1}^\infty$  is a Cauchy sequence in K. Let  $x_j^i \to x_j \in K$ , then we can check that  $v_i \to v = \sum_{j=1}^n x_j e_j$ .

**Theorem 6.3.** Let  $(K, |\cdot|)$  be complete and nonarchimedean and let V be a finite dimensional vector space over K. Then any two norms on V are equivalent. In particular, V is complete with respect to any norm.

*Proof.* Since equivalence defines an equivalence relation on the set of norms, it suffices to show that any norm  $||\cdot||$  is equivalent to the sup norm  $||\cdot||_{\sup}$  with respect to some basis. Let  $e_1, \ldots, e_n$  be a basis for V.

For the upper bound, set  $D = \max ||e_i||$ . Then if  $x = \sum_{i=1}^n x_i e_i$ , then  $||x|| = \max_i ||x_i e_i|| = \max_i |x_i|||e_i|| \le D \max_i |x_i| = D||x||_{\sup}$ .

To find C such that  $C||\cdot||_{\sup} \le ||\cdot||$ , we induct on  $n = \dim V$ . If n = 1, then  $||x|| = ||x_1e_1|| = |x_1|||e_1|| = ||x||_{\sup} ||e_1||$ , so take  $C = ||e_1||$ .

For n > 1, set  $V_i = \langle e_1, \dots, e_{i-1}, e_{i+1}, \dots, e_n \rangle$ . By induction, the norm on  $V_i$  is equivalent to the sup norm, so  $V_i$  is complete with respect to  $||\cdot||$ , hence closed. Then the translate  $e_i + V_i$  is also closed for all i, hence

$$S = \bigcup_{i=1}^{n} e_i + V_i$$

is a closed subset not containing zero. Hence  $\exists C>0$  such that  $S\cap B(0,C)=\varnothing$ , where  $B(0,c)=\{x\in V\mid ||x||< C\}$ . We claim this C works. To see this, let  $0\neq x=\sum_{i=1}^n x_ie_i$  and suppose  $|x_j|=\max_i|x_i|$ . Then  $||x||_{\sup}=|x_j|$  and  $\frac{1}{x_j}x\in S$  (since the  $j^{\text{th}}$  coefficient will be equal to 1). Thus  $||\frac{1}{x_j}x||\geq C$ , so  $||x||\geq C|x_j|=C||x||_{\sup}$ .

Finally, V is complete since it is complete with respect to  $||\cdot||_{\text{sup}}$ .

Proof of Theorem 6.1. We first show that  $|\cdot|_L = |N_{L/K}(\cdot)|^{1/n}$  satisfies the three absolute value axioms.

- (i)  $|y|_L = 0 \iff |N_{L/K}(y)|^{1/n} = 0 \iff N_{L/K}(y) = 0 \iff y = 0.$
- (ii)  $|y_1y_2|_L = |N_{L/K}(y_1y_2)|^{1/n} = |N_{L/K}(y_1)|^{1/n} |N_{L/K}(y_2)|^{1/n} = |y_1|_L |y_2|_L.$
- (iii) For this, we need some preparation:

**Definition 6.3.** Let  $R \subset S$  be a subring. We say  $s \in S$  is **integral** over R if s is a root of a monic polynomial with coefficients in R, i.e. monic  $f \in R[X]$  such that f(s) = 0.

The **integral closure**  $R^{\text{int}(S)}$  of R in S is the set of elements of S that are integral over R, i.e.

$$R \subset R^{\text{int}(S)} = \{ s \in S \mid s \text{ is integral over } R \}.$$

We say R is integrally closed in S if  $R^{int(S)} = R$ .

**Proposition 6.4.**  $R^{\text{int}(S)}$  is a subring of S. Moreover,  $R^{\text{int}(S)}$  is integrally closed in S.

*Proof.* Exercise on example sheet 2.

**Lemma 6.5.** Let  $(K, |\cdot|)$  be a nonarchimedean valued field. Then  $\mathcal{O}_K$  is integrally closed in K.

*Proof.* Let  $x \in K$  be integral over  $\mathcal{O}_K$ . WLOG assume  $x \neq 0$ . Let  $f(X) = X^n + a_{n-1}X^{n-1} + \ldots + a_0 \in \mathcal{O}_K[X]$  such that f(x) = 0. Then

$$x = -a_{n-1} - \dots - a_0 \frac{1}{x^{n-1}}.$$

If |x| > 1, then we have that  $\left| -a_{n-1} - \ldots - a_0 \frac{1}{x^{n-1}} \right| \le 1$  by the ultrametric inequality, contradiction. Thus  $|x| \le 1$ , so  $x \in \mathcal{O}_K$ .

Now we show (iii): Set  $\mathcal{O}_L = \{y \in L \mid |y|_L \leq 1\}$ . We claim that  $\mathcal{O}_L$  is the integral closure of  $\mathcal{O}_K$  inside L. In particular,  $\mathcal{O}_L$  is a subring of L.

Assuming this, let  $x, y \in L$  and WLOG assume  $|x|_L \leq |y|_L$ . Then we he  $\left|\frac{x}{y}\right|_L \leq 1 \implies \frac{x}{y} \in \mathcal{O}_L$ . Since  $\mathcal{O}_L$  is a ring,  $1 \in \mathcal{O}_L$ , so  $1 + \frac{x}{y} \in \mathcal{O}_L$  and hence  $\left|1 + \frac{x}{y}\right|_L \leq 1$ , so  $|x + y|_L \leq |y|_L = \max(|x|_L, |y|_L)$ , giving the ultrametric inequality property.

21 Oct 2022, E Lecture 7

To prove the claim, take  $0 \neq y \in L$  and let  $f(X) = X^d + a_{d-1}X^{d-1} + \ldots + a_0 \in K[X]$  be the minimal monic polynomial for y. We claim y is integral over  $\mathcal{O}_K \iff f(X) \in \mathcal{O}_K[X]$ .

 $(\Leftarrow)$ : This direction is clear.

 $(\Longrightarrow)$ : Let  $g(x) \in \mathcal{O}_K[X]$  be monic such that g(y) = 0. Then  $f \mid g$  in K[X] and hence every root of f is a root of g. Hence every root of f considered in  $\overline{K}$  is integral over  $\mathcal{O}_K$ . Hence the  $a_i$  are integral over  $\mathcal{O}_K$  for  $0 \le i \le d-1$ . Hence  $a_i \in \mathcal{O}_K$  by a lemma from last time.

By the corollary of the second version of Hensel's lemma,  $|a_i| \leq \max(|a_0|, 1)$ . By a property of the norm  $N_{L/K}$ , we have  $N_{L/K}(y) = \pm a_0^m \in \mathcal{O}_K$ . Hence  $y \in \mathcal{O}_L \iff |N_{L/K}(y)| \leq 1 \iff |a_0| \leq 1$ , so by our corollary this happens  $\iff |a_i| \leq 1 \ \forall i$ , i.e.  $a_i \in \mathcal{O}_K \ \forall i$ , so y is integral.

Since  $N_{L/K}(x) = x^n$  for  $x \in K$ ,  $|x|_L$  extends  $|\cdot|$  on K. If  $|\cdot|'_L$  is another absolute value on L extending  $|\cdot|$ , then  $|\cdot|_L$ ,  $|\cdot|'_L$  are norms on L, which are equivalent and hence induce the same topology on L, so  $|\cdot|'_L = |\cdot|^c_L$  for some c > 0. But since they both extend  $|\cdot|$  on K, we must have c = 1.

(ii): Theorem 6.3 implies the result, as L is complete with respect to the sup norm.  $\hfill\Box$ 

Corollary 6.6. Let  $(K, |\cdot|)$  be a complete, nonarchimedean discretely valued field and L/K a finite extension. Then

- (i) L is discretely valued with respect to  $|\cdot|_L$ .
- (ii)  $\mathcal{O}_L$  is the integral closure of  $\mathcal{O}_K$  in L.
- Proof. (i) Fix v, the valuation on K responding to our absolute value, and let  $v_L$  be the valuation on L extending v. Let n = [L:K]. For  $y \in L^{\times}$ ,  $|y|_L = |N_{L/K}(y)|^{1/n}$ , so  $v_L(y) = \frac{1}{n}v(N_{L/K}(y))$ , so  $v_L(L^{\times}) \subset \frac{1}{n}v(K^{\times})$ . Since  $v(K^{\times})$  is discrete, so is  $v_L$ .
- (ii) This was proved in the proof of the previous theorem.

**Corollary 6.7.** Let  $(K, |\cdot|)$  be complete, nonarchimedean, and discretely valued and let  $\overline{K}/K$  be the algebraic closure of K. Then  $|\cdot|$  extends uniquely to an absolute value  $|\cdot|_{\overline{K}}$  on  $\overline{K}$ .

*Proof.* Let  $x \in \overline{K}$ , then  $x \in L$  for some finite extension L/K. Define  $|\cdot|_{\overline{K}} = |x|_L$ . This is well–defined (i.e. independent of L) by uniqueness in Theorem 6.1 (for any L, L', consider an extension containing both).

The axioms for  $|x|_{\overline{K}}$  to be an absolute value can be checked over finite extensions.

Uniqueness again follows from the finite case: if two absolute values disagree on some value, then consider a finite extension containing that value.  $\Box$ 

**Remark.**  $|\cdot|_{\overline{K}}$  on  $\overline{K}$  is never discrete. For example, if  $K = \mathbb{Q}_p$ , then  $\sqrt[n]{p} \in \overline{\mathbb{Q}_p}$  and  $\forall n \geq 0$ ,  $v_p(\sqrt[n]{p}) = \frac{1}{n}v_p(n) = \frac{1}{n}$ , giving a non-discrete valuation. Furthermore,  $\overline{\mathbb{Q}_p}$  is not complete with respect to  $|\cdot|_{\overline{\mathbb{Q}_p}}$ . Showing this is an exercise on example sheet 2. On the sheet we also show that if we take  $\mathbb{C}_p$ , the completion of  $\overline{\mathbb{Q}_p}$  with respect to  $|\cdot|_{\overline{\mathbb{Q}_p}}$ , then  $\mathbb{C}_p$  is algebraically closed.

**Proposition 6.8.** Let L/K is a finite extension of complete discretely valued fields with n = [L:K]. Assume that

- (i)  $\mathcal{O}_K$  is compact.
- (ii) The extension  $k_L/k$  of residue fields is finite and separable.

Then there exists  $\alpha \in \mathcal{O}_L$  such that  $\mathcal{O}_L = \mathcal{O}_K[\alpha]$ .

Remark. We will later see that (i) implies (ii).

*Proof.* We'll choose  $\alpha \in \mathcal{O}_L$  such that:

- (i)  $\exists \beta \in \mathcal{O}_K[\alpha]$  a uniformizer for  $\mathcal{O}_L$ .
- (ii)  $\mathcal{O}_K[\alpha] \to k_L$  is surjective.

First note that  $k_L/k$  is separable, so  $\exists \overline{\alpha} \in k$  such that  $k_L = k(\overline{\alpha})$ . Let  $\alpha \in \mathcal{O}_L$  be a lift of  $\overline{\alpha}$  and  $g(X) \in \mathcal{O}_K[X]$  a monic lift of the minimal polynomial of  $\overline{\alpha}$ . Also fix  $\pi_L \in \mathcal{O}_L$  a uniformizer. Then  $\overline{g}(X) \in k[X]$  is irreducible and separable, so  $\overline{\alpha}$  is a simple root of  $\overline{g}$ , so  $g(\alpha) \equiv 0 \pmod{\pi_L}$  and  $g'(\alpha) \not\equiv 0 \pmod{\pi_L}$ .

If 
$$g(\alpha) \equiv 0 \pmod{\pi_L^2}$$
, then

$$g(\alpha + \pi_L) \equiv g(\alpha) + \pi_L g'(\alpha) \pmod{\pi_L^2}$$
.

Thus  $v_L(g(\alpha + \pi_L)) = v_L(\pi_L g'(\alpha)) = v_L(\pi) = 1$  for  $v_L$  the normalized valuation on L. Hence either  $v_L(g(\alpha)) = 1$  or  $v_L(\gamma(\alpha + \pi_L)) = 1$ . Possibly replacing  $\alpha$  by  $\alpha + \pi_L$ , we may assume that  $g(\alpha)$  is a uniformizer, i.e.  $v_L(g(\alpha)) = 1$ .

Now set  $\beta = g(\alpha) \in \mathcal{O}_K[\alpha]$ , a uniformizer. Then  $\mathcal{O}_K[\alpha] \subset L$  is the image of a continuous map  $\mathcal{O}_K^n \to L$  given by  $(x_0, \ldots, x_{n-1}) \mapsto \sum_{i=0}^{n-1} x_i \alpha^i$ . Since  $\mathcal{O}_K$  is compact,  $\mathcal{O}_K[\alpha]$  is compact, hence closed.

We have a closed subring of  $\mathcal{O}_L$ , so to show it is  $\mathcal{O}_L$ , it is enough to show it is dense. Since  $k_L = k(\overline{\alpha})$ ,  $\mathcal{O}_K[\alpha]$  contains a set of coset representatives for the residue field  $k_L = \mathcal{O}_L/\beta\mathcal{O}_L$ . Take  $y \in \mathcal{O}_L$ . By Proposition 3.3, we can write  $y = \sum_{i=0}^{\infty} \lambda_i \beta^i$  with  $\lambda_i \in \mathcal{O}_K[\alpha]$ . Then  $y_m = \sum_{i=0}^m \lambda_i \beta^i \in \mathcal{O}_K[\alpha]$  gives a Cauchy sequence converging to y. Then  $y \in \mathcal{O}_K[\alpha]$  since  $\mathcal{O}_K[\alpha]$  is closed.  $\square$ 

## 7 Local fields

**Definition 7.1.** Let  $(K, |\cdot|)$  be a valued field. We say K is a **local field** if it is complete and locally compact (i.e. every point contains a compact neighborhood).

**Example 7.1.**  $\mathbb{R}$  and  $\mathbb{C}$  are local fields.

**Proposition 7.1.** Let  $(K, |\cdot|)$  be a nonarchimedean complete valued field. Then the following are equivalent:

- (i) K is locally compact (so K is a nonarchimedean local field).
- (ii)  $\mathcal{O}_K$  is compact.
- (iii) The associated valuation v is discrete and  $k = \mathcal{O}_K/\mathfrak{m}$  is finite.

24 Oct 2022, Lecture 8

- *Proof.* (i)  $\Longrightarrow$  (ii): Let  $\mathcal{U} \ni 0$  be a compact neighborhood of 0 (i.e.  $0 \in \mathcal{U} \subset K$  for  $\mathcal{U}$  open, K compact). Then  $\exists x \in \mathcal{O}_K$  such that  $x\mathcal{O}_K \subset \mathcal{U}$ . Since  $x\mathcal{O}_K$  is closed, it is compact, so  $\mathcal{O}_K$  is compact (as it is homeomorphic to  $x\mathcal{O}_K$  by the homeomorphism  $x\mathcal{O}_K \stackrel{\times x^{-1}}{\longrightarrow} \mathcal{O}_K$ ).
- (ii)  $\implies$  (i):  $\mathcal{O}_K$  compact  $\implies a + \mathcal{O}_K$  compact  $\forall a \in K$ , so K is locally compact.
- (ii)  $\Longrightarrow$  (iii): Let  $x \in \mathfrak{m}$  and let  $A_x \subset \mathcal{O}_K$  be the set of coset representatives for  $\mathcal{O}_K/x\mathcal{O}_K$ . Then  $\mathcal{O}_K = \bigcup_{y \in A_x} (y + x\mathcal{O}_K)$ , which is a disjoint open cover. By compactness,  $A_x$  is finite. Hence  $\mathcal{O}_K/x\mathcal{O}_K$  is finite and so  $\mathcal{O}_K/\mathfrak{m}$  is finite. Now suppose v is not discrete. Then let  $x = x_1, x_2, x_3, \ldots$  be elements such that  $v(x_1) > v(x_2) > \ldots > 0$ . Then  $x\mathcal{O}_K \subsetneq x_2\mathcal{O}_K \subsetneq x_3\mathcal{O}_K \subsetneq \ldots \subsetneq \mathcal{O}_K$ . But  $\mathcal{O}_K/x\mathcal{O}_K$  is finite, so it can only have finitely many subgroups, a contradiction.
- (iii)  $\Longrightarrow$  (ii): Since  $\mathcal{O}_K$  is a metric space, it suffices to show that  $\mathcal{O}_K$  is sequentially compact, i.e. that every sequence has a convergent subsequence. Let  $(x_n)$  be a sequence in  $\mathcal{O}_K$  and fix  $\pi \in \mathcal{O}_K$  a uniformizer. Note that  $\pi^i\mathcal{O}_K/\pi^{i+1}\mathcal{O}_K \cong k$ , so  $\mathcal{O}_K/\pi^i\mathcal{O}_K$  is finite  $\forall i$  (as  $\mathcal{O}_K \supset \pi\mathcal{O}_K \supset \ldots \supset \pi^i\mathcal{O}_K$  are all finite). Since  $\mathcal{O}_K/\pi\mathcal{O}_K$  is finite,  $\exists a_1 \in \mathcal{O}_K/\pi\mathcal{O}_K$  and a subsequence  $(x_{1,n})_{n=1}^\infty$  such that  $x_{1,n} \equiv a_1 \pmod{\pi}$ . Since  $\mathcal{O}_K/\pi^2\mathcal{O}_K$  is finite,  $\exists a_2 \in \mathcal{O}_K/\pi^2\mathcal{O}_K$  and a subsequence  $(x_{2,n})_{n=1}^\infty$  of  $(x_{1,n})$  such that  $x_{2,n} \equiv a_2 \pmod{\pi^2}$ . Continuing in this fashion, we obtain sequences  $(x_{i,n})_{n=1}^\infty$  for  $i=1,2,3,\ldots$  such that
  - (i)  $(x_{i+1,n})$  is a subsequence of  $(x_{i,n})$  for all i.
- (ii) For any i,  $\exists a_i \in \mathcal{O}_K / \pi^i \mathcal{O}_K$  such that  $x_{i,n} \equiv a_i \pmod{\pi^i}$  for all n.

Then  $a_i \equiv a_{i+1} \pmod{\pi^i}$ . Now choose  $y_i = x_{i,i}$ . This defines a subsequence of  $(x_n)$  with  $y_i \equiv a_i \equiv a_{i+1} \equiv y_{i+1} \pmod{\pi^i}$ . Thus  $(y_i)$  is Cauchy, hence converges by completeness.

**Example 7.2.** (i)  $\mathbb{Q}_p$  is a local field, as it is discretely valued and has finite residue field  $\mathbb{F}_p$ .

(ii)  $\mathbb{F}_p((t))$  is a local field.

More on inverse limits: Again let  $(A_n)_{n=1}^{\infty}$  be a sequence of sets/groups/rings and let  $\phi_n: A_{n+1} \to A_n$  be homomorphisms (transition maps).

**Definition 7.2.** Assume each  $A_n$  is finite. Then the **profinite topology** on  $A = \varprojlim_n A_n$  is the weakest topology on A such that the projection maps  $\theta_n : A \to A_n$  are continuous for all n, where all  $A_n$  are equipped with the discrete topology.

Fact.  $A = \varprojlim_n A_n$  with the profinite topology is compact, totally disconnected and Hausdorff.

**Proposition 7.2.** Let K be a nonarchimedean local field. Under the isomorphism  $\mathcal{O}_K \cong \varprojlim_n \mathcal{O}_K / \pi^n \mathcal{O}_K$  (for  $\pi \in \mathcal{O}_K$  a uniformizer), the topology on  $\mathcal{O}_K$  coincides with the profinite topology.

*Proof sketch*: Check that the sets  $B = \{a + \pi^n \mathcal{O}_K \mid n \in \mathbb{Z}_{\geq 1}, a \in \mathcal{O}_K\}$  are a basis of open sets in both topologies.

For the topology arising from  $|\cdot|$ , this is clear (for any open ball, we can find a closed ball of smaller radius contained inside it).

For the profinite topology,  $\mathcal{O}_K \to \mathcal{O}_K/\pi^n\mathcal{O}_K$  is continuous if and only if  $a + \pi^n\mathcal{O}_K$  is open  $\forall a \in \mathcal{O}_K$ .

**Lemma 7.3.** Let K be a nonarchimedean local field and L/K a finite extension. Then L is a local field.

Proof. Theorem 6.1 shows that L is complete and discretely valued, so it suffices to show that  $k_L = \mathcal{O}_L/\mathfrak{m}_L$  is finite. Let  $\alpha_1, \ldots, \alpha_n \in L$  be a basis for L as a K-vector space. Then  $||\cdot||_{\sup}$ , the sup norm, is equivalent to  $|\cdot|_L$ , so there exists r > 0 such that  $\mathcal{O}_L \subset \{x \in L \mid ||x||_{\sup} \leq r\}$ . Then take  $a \in K$  such that  $|a| \geq r$ , then  $\mathcal{O}_L \subset \bigoplus_{i=1}^n a\alpha_i\mathcal{O}_K \subset L$ . But this is a finitely generated module over a PID, hence noetherian, so  $\mathcal{O}_L$  is finitely generated as an  $\mathcal{O}_K$ -module, so  $k_L$  is finitely generated over k.

**Definition 7.3.** A nonarchimedean valued field  $(K, |\cdot|)$  has **equal characteristic** if char(K) = char(k). Otherwise, K has **mixed characteristic**.

**Example 7.3.**  $\mathbb{Q}_p$  has mixed characteristic, whereas  $\mathbb{F}_p((t))$  has equal characteristic p > 0.

It turns out equal characteristic local fields are very easy to classify:

**Theorem 7.4.** Let K be a nonarchimedean local field of equal characteristic p > 0.<sup>4</sup> Then

$$K \cong \mathbb{F}_{p^n}((t))$$

for some  $n \geq 1$ .

*Proof.* K is complete and discretely valued with  $\operatorname{char}(K) > 0$ . Moreover, k is finite, so  $k \cong \mathbb{F}_{p^n}$  for some n, so k is perfect. Now by Theorem 5.4,  $K \cong \mathbb{F}_{p^n}(t)$ .

**Lemma 7.5.** An absolute value  $|\cdot|$  on a field K is nonarchimedean  $\iff$  |n| is bounded  $\forall n \in \mathbb{Z}$ .

*Proof.* ( $\Longrightarrow$ ): Since |-1|=|1|, |-n|=|n|. Thus it suffices to show that |n| is bounded for  $n \ge 1$ , but  $|n|=|1|+\ldots |1| \le |1|=1$  by the ultrametric inequality.

( $\iff$ ): Suppose  $|n| \leq B \ \forall n \in \mathbb{Z}$ . Take  $x, y \in K$  with  $|x| \leq |y|$ . Then we have

$$|x+y|^m = \left|\sum_{i=0}^m {m \choose i} x^i y^{m-i} \right| \le \sum_{i=0}^m \left| {m \choose i} x^i y^{m-i} \right| \le |y|^m B(m+1).$$

Take  $n^{\text{th}}$  roots to get  $|x+y| \leq |y| \sqrt[n]{B(m+1)} \stackrel{n \to \infty}{\to} |y| = \max(|x|,|y|).$ 

26 Oct 2022, Lecture 9

**Theorem 7.6** (Ostrowski's Theorem). Any nontrivial absolute value on  $\mathbb{Q}$  is equivalent to either  $|\cdot|_{\infty}$  or the p-adic absolute value  $|\cdot|_p$  for some prime p.

*Proof.* Case 1:  $|\cdot|$  is archimedean. Then fix b > 1 such that |b| > 1, where such a b exists by the previous lemma. Take a > 1 another integer and write  $b^n$  in base a, i.e.  $b^n = c_m a^m + c_{m-1} a^{m-1} + \ldots + c_0$  for  $0 \le c_i < a$  and  $c_m \ne 0$ .

Let  $B = \max_{0 \le c \le a}(|c|)$ , then  $|b^n| \le (m+1)B\max(|a|^m, 1)$ . Hence

$$|b| = \underbrace{[(n\log_a b + 1)B]^{1/n}}_{\rightarrow 1 \text{ as } n \rightarrow \infty} \max(|a|^{\log_a(b)}, 1)$$
$$\implies |b| < \max(|a|^{\log_a(b)}, 1).$$

<sup>&</sup>lt;sup>4</sup>Note the residue field of an an equal characteristic nonarchimedean local field is finite, so the characteristic must be positive.

Then |a| > 1 and  $|b| \le |a|^{\log_a(b)}$  (†). Switching the roles of a and b we also find  $|a| \le |b|^{\log_b(a)}$  (‡). Then (†) and (‡) imply  $\frac{\log |a|}{\log a} = \frac{\log |b|}{\log b} = \lambda \in \mathbb{R}_{>0}$ . Hence  $|a| = a^{\lambda} \ \forall a \in \mathbb{Z}_{\geq 1}$ , so  $|x| = |x|_{\infty}^{\lambda} \ \forall x \in \mathbb{Q}$ , so  $|\cdot|$  is equivalent to  $|\cdot|_{\infty}$ .

Case 2:  $|\cdot|$  is non-archimedean. As in the previous inequality, we have  $|n| \leq 1 \ \forall n \in \mathbb{Z}$ . Since this absolute value is nontrivial,  $\exists n \in \mathbb{Z}_{\geq 1}$  such that |n| < 1. Write  $n = p_1^{e_1} \dots p_r^{e_r}$ . Then |p| < 1 for some  $p \in \{p_1, \dots, p_r\}$ . Now suppose |q| < 1 for some prime  $q \neq p$ . Then write 1 = rp + sq for some  $r, s \in \mathbb{Z}$ . Then  $1 = |rp + sq| \leq \max(|rp|, |sq|) < 1$ , a contradiction. Thus  $|p| = \alpha < 1$  and |q| = 1 for all primes  $q \neq p$ . Hence  $|\cdot|$  is equivalent to  $|\cdot|_p$ .

**Theorem 7.7.** Let  $(K, |\cdot|)$  be a nonarchimedean local field of mixed characteristic. Then K is a finite extension of  $\mathbb{Q}_p$ .

*Proof.* K has mixed characteristic  $\implies$  char $(K) = 0 \implies \mathbb{Q} \subset K$ . Also, K is nonarchimedean  $\implies |\cdot||_{\mathbb{Q}} \sim |\cdot|_p$  for some p. Since K is complete,  $\mathbb{Q}_p \subset K$ . Hence it suffices to show that  $\mathcal{O}_K$  is finite as a  $\mathbb{Z}_p$ -module.

Let  $\pi \in \mathcal{O}_K$  be a uniformizer and v a normalized valuation on K. Set v(p) = e. Then  $\mathcal{O}_K/p\mathcal{O}_K \cong \mathcal{O}_K/\pi^e\mathcal{O}_K$ , which is finite (since  $\pi^i\mathcal{O}_K/\pi^{i+1}\mathcal{O}_K \cong k$  is finite).  $\mathbb{F}_p = \mathbb{Z}_p/\mathbb{Z}_p \hookrightarrow \mathcal{O}_K/p\mathcal{O}_K$ , so  $\mathcal{O}_K/p\mathcal{O}_K$  is a finite-dimensional vector space over  $\mathbb{F}_p$ . Let  $x_1, \ldots, x_n \in \mathcal{O}_K$  be coset representatives for the  $\mathbb{F}_p$ -basis of  $\mathcal{O}_K/p\mathcal{O}_K$ . Then

$$\left\{ \sum_{i=1}^{n} a_{j} x_{j} \mid a_{j} \in \{0, \dots, p-1\} \right\}$$

gives a set of coset representatives for  $\mathcal{O}_K/p\mathcal{O}_K$ .

Now apply Proposition 3.3 (ii) to write (for  $a_{ij} \in \{0, ..., p-1\}$ )

$$y = \sum_{i=0}^{\infty} \left( \sum_{j=1}^{n} a_{ij} x_j \right) p^i = \sum_{j=1}^{n} \underbrace{\left( \sum_{i=0}^{\infty} a_{ij} p^i \right)}_{\in \mathbb{Z}_p} x_j.$$

Hence  $\mathcal{O}_K$  is finite over  $\mathbb{Z}_p$ .

On example sheet 2, we show that if K is a complete archimedean field, then  $K \cong \mathbb{R}$  or  $K \cong \mathbb{C}$ .

In summary, if K is a local field, then either:

- (i) K is archimedean, so  $K \cong \mathbb{R}$  or  $K \cong \mathbb{C}$ .
- (ii) K is nonarchimedean of equal characteristic, so  $K \cong \mathbb{F}_{p^n}((t))$ .
- (iii) K is nonarchimedean of mixed characteristic, so K is a finite extension of  $\mathbb{Q}_p$ .

### 8 Global fields

**Definition 8.1.** A **global field** is a field which is either

- (i) an algebraic number field.
- (ii) a global function field, i.e. a finite extension of  $\mathbb{F}_p(t)$ .

**Lemma 8.1.** Let  $(K, |\cdot|)$  be a complete discretely valued field and L/K a finite Galois extension with absolute value  $|\cdot|_L$  extending  $|\cdot|_K$ . Then for  $x \in L$  and  $\sigma \in \operatorname{Gal}(L/K)$ , we have  $|\sigma(x)|_L = |x|_L$ .

*Proof.* Since  $x \mapsto |\sigma(x)|_L$  is an absolute value on L (as we can check) extending  $|\cdot|_K$ , our result follows from uniqueness of extensions of absolute values.

**Lemma 8.2** (Krasner's lemma). Let  $(K, |\cdot|)$  be discretely valued and let  $f(X) \in K[X]$  be a separable irreducible polynomial with roots  $\alpha_1, \ldots, \alpha_n \in \overline{K}$ , the separable closure of K. Suppose  $\beta \in \overline{K}$  is such that

$$|\beta - \alpha_1| < |\beta - \alpha_i| \ \forall 2 \le i \le n.$$

Then  $\alpha_1 \in K(\beta)$ .

*Proof.* Let  $L = K(\beta)$  and  $L' = L(\alpha_1, \ldots, \alpha_n)$ . Then L'/L is a Galois extension. Let  $\sigma \in \operatorname{Gal}(L'/L)$ . We have  $|\beta - \sigma(\alpha_1)| = |\sigma(\beta - \alpha_1)| = |\beta - a_1|$  by the previous lemma and hence  $\sigma(\alpha_1) = \alpha_1$ , so  $\alpha_1 \in K(\beta)$ .

**Proposition 8.3.** Let  $(K, |\cdot|)$  be a complete discretely valued field and let  $f(X) = \sum_{i=0}^{n} a_i X^i \in \mathcal{O}_K[X]$  be a separable irreducible monic polynomial. Let  $\alpha \in \overline{K}$  be a root of f. Then  $\exists \epsilon > 0$  such that for any other polynomial  $g(x) = \sum_{i=0}^{n} b_i X^i \in \mathcal{O}_K[X]$  monic with  $|a_i - b_i| < \epsilon \ \forall i$ , there exists a root  $\beta$  of g(x) such that  $K(\alpha) = K(\beta)$ .

Informally, "nearby" polynomials define the same extension.

Proof. Let  $\alpha = \alpha_1, \alpha_2, \ldots, \alpha_n \in \overline{K}$  be the roots of f, which are distinct. Then  $f'(\alpha_1) \neq 0$ . We choose  $\epsilon$  such that  $|g(\alpha_1)| < |f'(\alpha_1)|^2$  and  $|f'(\alpha_1) - g'(\alpha_1)| < |f'(\alpha_1)|$ . Then  $|g(\alpha_1)| < |f'(\alpha_1)^2| = |g'(\alpha_1)^2|$  (as all triangles are isosceles). By Hensel's lemma applied to the field  $K(\alpha_1)$ , there exists  $\beta \in K(\alpha_1)$  such that  $g(\beta) = 0$  and  $|\beta - \alpha_1| < |g'(\alpha_1)|$ . But  $|g'(\alpha_1)| = |f'(\alpha_1)| = \prod_{i=2}^n |\alpha_1 - \alpha_i| \leq |\alpha_1 - \alpha_i|$  for  $2 \leq i \leq n$  (using  $|\alpha_1 - \alpha_i| \leq 1$  since  $\alpha_i$  is integral as f is monic). Since  $|\beta - \alpha_1| < |\alpha_1 - \alpha_i| = |\beta - \alpha_i|$  (again by isosceles condition), Krasner's lemma tells us that  $\alpha \in K(\beta)$  and so  $K(\alpha) = K(\beta)$ .

**Theorem 8.4.** Let K be a local field. Then K is the completion of a global field.

*Proof.* Case 1:  $|\cdot|$  is archimedean. Then  $\mathbb{R}, \mathbb{C}$  are the completions of  $\mathbb{Q}, \mathbb{Q}(i)$ , respectively, with respect to  $|\cdot|_{\infty}$ .

Case 2:  $|\cdot|$  is non–archimedean and of equal characteristic. Then  $K \cong \mathbb{F}_p((t))$ , and so K is the completion of  $\mathbb{F}_p(t)$  with respect to the t-adic absolute value.

Case 3:  $|\cdot|$  is non-archimedean and of mixed characteristic. Then  $K = \mathbb{Q}_p(\alpha)$  for  $\alpha$  a root of a monic irreducible polynomial  $f(X) \in \mathbb{Z}_p[X]$  (primitive element theorem). Since  $\mathbb{Z}$  is dense in  $\mathbb{Z}_p$ , we choose  $g(X) \in \mathbb{Z}[X]$  as in Proposition 8.3. Then  $K = \mathbb{Q}_p(\beta)$  for  $\beta$  a root of g(X). Since  $\mathbb{Q}(\beta)$  is dense in  $\mathbb{Q}_p(\beta) = K$ , K is the completion of  $\mathbb{Q}(\beta)$ .

### 9 Dedekind domains

**Definition 9.1.** A Dedekind domain is a ring R such that

- (i) R is a Noetherian integral domain.
- (ii) R is integrally closed in Frac(R).
- (iii) Every nonzero prime ideal of R is maximal.

**Example 9.1.** The ring of integers in a number field is a Dedekind domain (we will show this later). This is the prototypical example. Also, any PID (hence DVR) is a Dedekind domain.

**Theorem 9.1.** A ring is a DVR  $\iff$  R is a Dedekind domain with exactly one nonzero prime ideal.

We start with two lemmas.

**Lemma 9.2.** Let R be a Noetherian ring and  $I \subset R$  a nonzero ideal. Then there exist nonzero prime ideals  $\mathfrak{p}_1, \ldots, \mathfrak{p}_r$  such that  $\mathfrak{p}_1 \ldots \mathfrak{p}_r \subset I$ .

*Proof.* Suppose not. Since R is Noetherian, we can choose I maximal with this property. Then I is not prime, so  $\exists x, y \in R \setminus I$  such that  $xy \in I$ . Let  $I_1 = I + (x)$  and  $I_2 = I + (y)$ . Then by the maximality of I,  $\exists \mathfrak{p}_1, \ldots, \mathfrak{p}_r$  and  $\mathfrak{q}_1, \ldots, \mathfrak{q}_s$  such that  $\mathfrak{p}_1 \ldots \mathfrak{p}_r \subset I_1$  and  $\mathfrak{q}_1 \ldots \mathfrak{q}_s \subset I_2$ , so  $\mathfrak{p}_1 \ldots \mathfrak{p}_r \mathfrak{q}_1 \ldots \mathfrak{q}_s \subset I_1 I_2 \subset I$ , a contradiction.

**Lemma 9.3.** Let R be an integral domain which is integrally closed in  $K = \operatorname{Frac}(R)$ . Let  $0 \neq I \subset R$  be finitely generated and let  $x \in K$ . If  $xI \subset I$ , then  $x \in R$ .

*Proof.* Let  $I=(c_1,\ldots,c_n)$ . We write  $xc_i=\sum_{j=1}^n a_{ij}c_j$  for  $a_{ij}\in R$ . Let  $A=(a_{ij})$  be the matrix given by the  $a_{ij}$  and set  $B=xI-A\in M_{n\times n}(K)$ . Let

 $\operatorname{Adj}(B)$  be the adjugate matrix for B. Then  $B\begin{pmatrix} c_1 \\ \vdots \\ c_n \end{pmatrix} = 0$  in  $K^n$ , so multiplying

by the adjugate gives  $\det(B)I\begin{pmatrix} c_1 \\ \vdots \\ c_n \end{pmatrix} = 0 \implies \det(B) = 0$ . But  $\det(B)$  is just

a monic polynomial in x with coefficients in R. Thus x is integral over R, so  $x \in R$  as R is integrally closed.

*Proof of Theorem 9.1.* (  $\Longrightarrow$  ): This is clear, as any PID, so any DVR, is a Dedekind domain.

( $\iff$ ): We need to show that R is a PID. The assumption implies that R is a local ring with unique maximal ideal  $\mathfrak{m}$ .

Step 1:  $\mathfrak{m}$  is principal. Let  $0 \neq x \in \mathfrak{m}$ . By Lemma 9.2,  $(x) \supset \mathfrak{m}^n$  for some  $n \geq 1$ . Let n be minimal such that  $(x) \supset \mathfrak{m}^n$ . Then we may choose  $y \in \mathfrak{m}^{n-1} \setminus (x)$ . Set  $\pi = \frac{x}{y}$ . Then we have  $y\mathfrak{m} \subset \mathfrak{m}^n \subset (x) \implies p^{-1}\mathfrak{m} \subset R$ . If  $\pi$  is a proper ideal and not the whole ring, then  $\pi^{-1}\mathfrak{m} \subset \mathfrak{m}$ , so  $\pi^{-1} \in R$  by Lemma 9.3. Thus  $y \in (x)$ , a contradiction. Hence  $\pi^{-1}\mathfrak{m} = R \implies \mathfrak{m} = \pi R$  is principal.

Step 2: R is a PID. Let  $I \subset R$  be a nonzero ideal. Consider the sequence of fractional ideals  $I \subset \pi^{-1}I \subset \pi^{-2}I \subset \ldots$  in K. Since  $\pi^{-1} \notin R$ , we have  $\pi^{-k}I \neq \pi^{-k+1}I \ \forall k$  by Lemma 9.3. Since R is Noetherian, we may choose n maximal such that  $\pi^{-n}I \subset R$ . If  $\pi^{-n}I \subset \mathfrak{m} = (\pi)$ , then  $\pi^{-(n+1)}I \subset R$ , contradicting the maximality of R. Hence  $\pi^{-n}I = R \implies I = \pi^n R$ .

**Definition 9.2.** Let R be an integral domain and let  $S \subset R$  be a multiplicatively closed subset (i.e.  $1 \in S$  and  $x, y \in S \implies xy \in S$ ). The **localization**  $S^{-1}R$  of R with respect to S is the ring

$$S^{-1}R = \left\{ \frac{r}{s} \mid r \in R, s \in S \right\} \subset \operatorname{Frac}(R).$$

If  $\mathfrak{p}$  is a prime ideal in R, we write  $R_{(\mathfrak{p})}$  for the localization with respect to  $S = R \setminus \mathfrak{p}$ .

**Example 9.2.** • If  $\mathfrak{p} = 0$ , then  $R_{(\mathfrak{p})} = \operatorname{Frac}(R)$ .

• If  $R = \mathbb{Z}$ , then  $\mathbb{Z}_{(p)} = \left\{ \frac{a}{b} \mid a, b \in \mathbb{Z}, (b, p) = 1 \right\}$  (as seen before as a valuation ring).

**Fact.** R Noetherian  $\implies S^{-1}R$  Noetherian.

Fact. There exists a bijection between

{prime ideals in 
$$S^{-1}R$$
}  $\leftrightarrow$ {prime ideals  $\mathfrak p$  in  $R$  with  $\mathfrak p\cap S=\varnothing$ }. 
$$\mathfrak p S^{-1}R \leftarrow \mathfrak p.$$

Corollary 9.4. Let R be a Dedekind domain and  $\mathfrak{p} \subset R$  a nonzero prime ideal. Then  $R_{(\mathfrak{p})}$  is a DVR. <sup>5</sup>

*Proof.* By properties of localization,  $R_{(\mathfrak{p})}$  is a Noetherian integral domain with a unique nonzero prime ideal  $\mathfrak{p}R_{(\mathfrak{p})}$ . It suffices to show that  $R_{(\mathfrak{p})}$  is integrally closed in  $\operatorname{Frac}(R_{(\mathfrak{p})}) = \operatorname{Frac}(R)$ , since then the localization of  $\mathfrak{p}$  is a Dedekind domain by Theorem 9.1.

Let  $x \in \operatorname{Frac}(R)$  be integral over  $R_{(\mathfrak{p})}$ . Multiplying out by the denominators of a monic polynomial satisfied by x, we obtain

$$sx^n + a_{n-1}x^{n-1} + \ldots + a_0 = 0$$

where  $a_i \in R, s \in S$ . Multiply this by  $s^{-1}$  to get that xs is integral over R and hence  $xs \in R$ , thus  $x \in R_{(\mathfrak{p})}$ .

 $<sup>^5{</sup>m This}$  is the correct way to think about Dedekind domains.
