19 Jan 2024, Lecture 1

Let  $G = \mathbb{F}_p^n$  for p a small fixed prime (usually p = 2, 3, 5) and n is large (often we consider  $n \to \infty$ ).

**Notation.** Given a finite set B and any function  $f: B \to \mathbb{C}$ , we write  $\mathbb{E}_{x \in B} f(x)$  to mean  $\frac{1}{B} \sum_{x \in B} f(x)$ . Also write  $\omega = e^{2\pi i/p}$  for the  $p^{\text{th}}$  root of unity. Note that  $\sum_{a \in \mathbb{F}_p} \omega^a = 0$ .

**Definition 1.1.** Given  $f: \mathbb{F}_p^n: \mathbb{C}$ , we define its **Fourier transform**  $\hat{f}: \mathbb{F}_p^n \to \mathbb{C}$  by

$$\hat{f}(t) = \mathbb{E}_{x \in \mathbb{F}_p^n} f(x) \omega^{x \cdot t} \ \forall t \in \mathbb{F}_p^n$$

where  $x \cdot t$  is the standard scalar product.

It is easy to verify the **inversion formula**:

$$f(x) = \sum_{t \in \mathbb{F}_p^n} \hat{f}(t) \omega^{-x \cdot t} \ \forall x \in \mathbb{F}_p^n.$$

Indeed,

$$\sum_{t \in \mathbb{F}_p^n} \hat{f}(t)\omega^{-x \cdot t} = \sum_{t \in \mathbb{F}_p^n} \left( \mathbb{E}_y f(y)\omega^{y \cdot t} \right) \omega^{-x \cdot t}$$
$$= \mathbb{E}_y f(y) \underbrace{\sum_{t \in \mathbb{F}_p^n} \omega^{(y-x) \cdot t}}_{p^n 1_{\{y=x\}}} = f(x).$$

**Remark.** We could use an unnormalized sum in our definition and a normalized sum in the inversion formula, or a minus sign in our definition and a plus sign in the inversion formula – this doesn't matter as long as we're consistent.

Given a subset A of a finite group G, write:

- $1_A$  for the **characteristic function** of A, i.e.  $1_A(x) = \begin{cases} 1 & \text{if } x \in A \\ 0 & \text{if } x \notin A \end{cases}$ . This is also called the **indicator function**.
- $f_A$  for the **balanced function** of A, i.e.  $f_A(x) = 1_A(x) \alpha$ , where  $\alpha = \frac{|A|}{|G|}$ .
- $\mu_A$  for the **characteristic measure** of A, i.e.  $\mu_A(x) = \alpha^{-1} 1_A(x)$ .

Note  $\mathbb{E}_{x \in G} f_A(x) = 0$  and  $\mathbb{E}_{x \in G} \mu_A(x) = 1$ . Given  $A \subset \mathbb{F}_p^n$ , we have

$$\hat{1}_A(t) = \mathbb{E}_{x \in \mathbb{F}_p^n} 1_A(x) \omega^{x \cdot t}.$$

At t = 0, we get  $\hat{1}_A(0) = \mathbb{E}_{x \in \mathbb{F}_p^n} 1_A(x) = \alpha$ .

Writing  $-A = \{-a \mid a \in A\}$ , we have

$$\hat{1}_{-A}(t) = \mathbb{E}_{x \in \mathbb{F}_p^n} 1_{-A}(x) \omega^{x \cdot t} = \mathbb{E}_{x \in \mathbb{F}_p^n} 1_A(-x) \omega^{x \cdot t}$$

$$\stackrel{y = -x}{=} \mathbb{E}_{y \in \mathbb{F}_p^n} 1_A(y) \omega^{-y \cdot t} = \overline{\mathbb{E}_{y \in \mathbb{F}_p^n} 1_A(y) \omega^{y \cdot t}} = \overline{\hat{1}_A(t)}.$$

**Example 1.2.** Let  $V \leq \mathbb{F}_p^n$ . Then

$$\hat{1}_{V}(t) = \mathbb{E}_{x \in \mathbb{F}_{p}^{n}} 1_{V}(x) \omega^{x \cdot t} = \frac{|V|}{p^{n}} 1_{\{x \cdot t = 0 \ \forall x \in V\}} = \frac{|V|}{p^{n}} 1_{V^{\perp}}(t),$$

so  $\hat{\mu}_V(t) = 1_{V^{\perp}}(t)$ . (Here we use the fact that if  $t \notin \{x \cdot t = 0 \ \forall x \in V\}$ , then  $x \cdot t$  runs over the values uniformly and the sum is zero - details left as exercise).

**Example 1.3.** Let  $R \subset \mathbb{F}_p^n$  be such that each  $x \in \mathbb{F}_p^n$  lies in R independently with probability  $\frac{1}{2}$ . Then with high probability (i.e.  $\mathbb{P} \to 1$  as  $n \to \infty$ ),

$$\sup_{t \neq 0} |\widehat{1}_R(t)| = O\left(\sqrt{\frac{\log(p^n)}{p^n}}\right).$$

Proving this is on Ex. Sheet 1. This is proved using a Chernoff-type bound: given complex-valued independent random variables  $X_1, \ldots, X_n$  with mean 0,  $\forall \theta \geq 0$ ,

$$\mathbb{P}\left(\left|\sum_{i=1}^n X_i\right| \geq \theta \sqrt{\sum_{i=1}^n ||X_i||_{L^{\infty}(\mathbb{P})}^2}\right) \leq 4 \exp\left(-\theta^2/4\right).$$

**Example 1.4.** Let  $Q = \{x \in \mathbb{F}_p^n \mid x \cdot x = 0\}$ . Then  $|Q| = \left(\frac{1}{p} + O(p^{-n})\right) p^n$  and  $\sup_{t \neq 0} |\hat{1}_Q(t)| = O(p^{-n/2})$ . This is again on Ex. Sheet 1.

**Notation.** Given  $f, g : \mathbb{F}_p^n \to \mathbb{C}$ , write

$$\langle f, g \rangle = \mathbb{E}_{x \in \mathbb{F}_p^n} f(x) \overline{g(x)}$$

and

$$\langle \hat{f}, \hat{g} \rangle = \sum_{t \in \mathbb{F}_p^n} \hat{f}(t) \overline{\hat{g}(t)}.$$

Consequently,  $||f||_2^2 = \mathbb{E}_x |f(x)|^2$  and  $||\hat{f}||_2^2 = \sum_t |\hat{f}(t)|^2$ .

**Lemma 1.5.** The following hold for all  $f, g : \mathbb{F}_p^n \to \mathbb{C}$ :

- (i)  $\langle f, g \rangle = \langle \hat{f}, \hat{g} \rangle$  (Plancherel's identity).
- (ii)  $||f||_2 = ||\hat{f}||_2$  (Parseval's identity).

Proof. (ii) follows from (i). For (i), compute

$$\begin{split} \langle \hat{f}, \hat{g} \rangle &= \sum_{t \in \mathbb{F}_p^n} \hat{f}(t) \overline{\hat{g}(t)} = \sum_{t \in \mathbb{F}_p^n} \frac{1}{p^{2n}} \sum_{x \in \mathbb{F}_p^n} f(x) \omega^{x \cdot t} \sum_{y \in \mathbb{F}_p^n} \overline{g(y)} \omega^{y \cdot t} \\ &= \frac{1}{p^{2n}} \sum_{x, y \in \mathbb{F}_p^n} f(x) \overline{g(y)} \sum_{t \in \mathbb{F}_p^n} \omega^{(x-y)t} = \frac{1}{p^{2n}} \sum_{x \in \mathbb{F}_p^n} p^n f(x) \overline{g(x)} = \langle f, g \rangle. \end{split}$$

**Definition 1.6.** Let  $\rho > 0$  and  $f : \mathbb{F}_p^n \to \mathbb{C}$ . Define the  $\rho$ -large spectrum of f to be

$$\operatorname{Spec}_{\rho}(f) = \{ t \in \mathbb{F}_p^n \mid |\hat{f}(t)| \ge \rho ||f||_1 \}.$$

**Example 1.7.** By Example 1.2, if  $f=1_V$  with  $V\leq \mathbb{F}_p^n$ , then  $\forall \rho>0$ ,  $\operatorname{Spec}_o(f)=V^{\perp}$ .

**Lemma 1.8.** For all  $\rho > 0$ ,  $|\operatorname{Spec}_{\rho}(f)| \leq \rho^{-2} \frac{||f||_2^2}{||f||_1^2}$ 

Proof. By Parseval,

$$||f||_2^2 = ||\hat{f}||_2^2 \geq \sum_{t \in \operatorname{Spec}_{\rho}(f)} |\hat{f}(t)^2| \geq |\operatorname{Spec}_{\rho}(f)|(\rho||f||_1)^2.$$

22 Jan 2024,

**Definition 1.9.** Given  $f, g : \mathbb{F}_p^n \to \mathbb{C}$ , define their **convolution**  $f * g : \mathbb{F}_p^n \to \mathbb{C}$  by

$$f * g(x) = \mathbb{E}_{y \in \mathbb{F}_p^n} f(y) g(x - y) \ \forall x \in \mathbb{F}_p^n.$$

**Example 1.10.** Given  $A, B \subset \mathbb{F}_p^n$ ,

$$\begin{aligned} \mathbf{1}_A * \mathbf{1}_B(x) &= \mathbb{E}_{y \in \mathbb{F}_p^n} \mathbf{1}_A(y) \mathbf{1}_B(x - y) = \frac{1}{p^n} |A \cap (x - B)| \\ &= \frac{1}{p^n} \# \text{ways } x \text{ can be written as } x = a + b \text{ with } a \in A, b \in B. \end{aligned}$$

In particular, the support of  $1_A * 1_B$  is the **sum set** 

$$A + B = \{a + b \mid a \in A, b \in B\}$$

of A and B.

**Lemma 1.11.** Given  $f, g : \mathbb{F}_p^n \to \mathbb{C}$ ,

$$\widehat{f * g}(t) = \widehat{f}(t)\widehat{g}(t) \ \forall t \in \mathbb{F}_p^n.$$

<sup>&</sup>lt;sup>1</sup>Here we have  $0 < \rho \le 1$ , since it is clear by triangle inequality that  $||f||_1 \ge |\hat{f}(t)|$ .

*Proof.* Set u = x - y to get

$$\widehat{f * g}(t) = \mathbb{E}_{x \in \mathbb{F}_p^n} \left( \mathbb{E}_{y \in \mathbb{F}_p^n} f(y) g(x - y) \right) \omega^{x \cdot t}$$

$$= \mathbb{E}_y f(y) \mathbb{E}_u g(u) \omega^{(u+y) \cdot t}$$

$$= \hat{f}(t) \hat{g}(t).$$

**Example 1.12.**  $||\hat{f}||_4^4 = \mathbb{E}_{x+y=z+w} f(x) f(y) \overline{f(z) f(w)}$ . This is on Ex. Sheet 1.

**Lemma 1.13** (Bogolyubov's Lemma). Given  $A \subset \mathbb{F}_p^n$  of density  $\alpha > 0$ , there exists a subspace  $V \leq \mathbb{F}_p^n$  of codimension at most  $2\alpha^{-2}$  s.t.  $A + A - A - A \supset V$ .

*Proof.* Observe that

$$A + A - A - A = \text{supp}(\underbrace{1_A * 1_A * 1_{-A} * 1_{-A}}_{:=g}).$$

Hence we wish to find  $V \leq \mathbb{F}_p^n$  such that  $g(x) > 0 \ \forall x \in V$ . Let  $K = \operatorname{Spec}_{\rho}(1_A)$  with  $\rho$  to be determined later and let  $V = \langle K \rangle^{\perp}$ . By Lemma 1.8<sup>2</sup>,  $|K| \leq \rho^{-2}\alpha^{-1}$  and hence  $\operatorname{codim}(V) \leq |K| \leq \rho^{-2}\alpha^{-1}$ . By the inversion formula,

$$\begin{split} g(x) &= \sum_{t \in \mathbb{F}_p^n} (1_A * \widehat{1_A} * \widehat{1_{-A}} * 1_{-A})(t) \omega^{-x \cdot t} \\ &= \sum_{t \in \mathbb{F}_p^n} |\widehat{1}_A(t)|^4 \omega^{-x \cdot t} \\ &= \alpha^4 + \sum_{\substack{t \in K \setminus \{0\} \\ (1)}} |\widehat{1}_A(t)|^4 \omega^{-x \cdot t} + \sum_{\substack{t \not \in K \\ (2)}} |\widehat{1}_A(t)|^4 \omega^{-x \cdot t} \,. \end{split}$$

For (1), we see it is  $\geq 0$  since  $x \cdot t = 0 \ \forall t \in K, x \in V$ . (Note we could give better lower bounds but we don't need them).

For (2), we have

$$\begin{aligned} |(2)| &\leq \sum_{t \notin K} |\hat{1}_A(t)|^4 \leq \sup_{t \notin K} |\hat{1}_A(t)|^2 \sum_{t \notin K} |\hat{1}_A(t)|^2 \leq \sup_{t \notin K} |\hat{1}_A(t)|^2 \sum_{t} |\hat{1}_A(t)|^2 \\ &\leq (\rho \alpha)^2 ||1_A||_2^2 = \rho^2 \alpha^3. \end{aligned}$$

Now pick 
$$\rho$$
 such that  $\rho^2 \alpha^3 \leq \frac{\alpha^4}{2}$ , e.g.  $\rho = \sqrt{\frac{\alpha}{2}}$ , so  $g(x) \geq \frac{\alpha^4}{2} > 0 \ \forall x \in V$ .  $\square$ 
<sup>2</sup>Here  $f = 1_A$  and  $\alpha = \frac{||f||_1^2}{||f||_2^2} = \frac{\left(\frac{1}{p^n} \sum |f|\right)^2}{\left(\frac{1}{p^n} \sum |f|^2\right)} = \frac{|A|}{p^n} = \alpha$ .

**Example 1.14.** The set  $A = \{x \in \mathbb{F}_2^n \mid |x| \geq \frac{n}{2} + \frac{\sqrt{n}}{2}\}$  has density at least  $\frac{1}{4}$ , and there is no coset C of any subspace of codimension at most  $\sqrt{n}$  such that  $C \subset A + A$ . This is on Ex. Sheet 1.

**Lemma 1.15.** Let  $A \subset \mathbb{F}_p^n$  of density  $\alpha$  be such that  $\exists t \neq 0$  in  $\operatorname{Spec}_{\rho}(1_A)$ . Then  $\exists V \leq \mathbb{F}_p^n$  of codimension 1 and  $\exists x \in \mathbb{F}_p^n$  such that

$$|A \cap (x+V)| \ge \alpha \left(1 + \frac{\rho}{2}\right) |V|.$$

*Proof.* Let  $t \neq 0$  be such that  $|\hat{1}_A(t)| \geq \rho \alpha$  and let  $V = \langle t \rangle^{\perp}$ . Write  $v_j + V$  for  $j \in [p] := \{1, 2, \dots, p\}$  for the cosets of V such that  $v_j + V = \{x \in \mathbb{F}_p^n \mid x \cdot t = j\}$ . Then

$$\rho\alpha \leq \hat{1}_{A}(t) = \hat{f}_{A}(t)$$

$$= \mathbb{E}_{x \in \mathbb{F}_{p}^{n}} (1_{A}(x) - \alpha) \omega^{x \cdot t}$$

$$= \mathbb{E}_{j \in [p]} \underbrace{\mathbb{E}_{x \in v_{j} + V} (1_{A}(x) - \alpha)}_{:=a_{j} = \frac{|A \cap (v_{j} + V)|}{|V|} - \alpha} \omega^{j}.$$

By the triangle inequality,  $\mathbb{E}_{j\in[p]}|a_j|\geq \rho\alpha$ . Since  $\mathbb{E}_{j\in[p]}a_j=\frac{|A|}{p^{n-1}}-p\alpha=0$ ,  $\mathbb{E}_{j\in[p]}(a_j+|a_j|)\geq \rho\alpha$ , so  $\exists j\in[p]$  such that  $a_j+|a_j|\geq \rho\alpha \implies a_j\geq \frac{\rho\alpha}{2}$ .

24 Jan 2024, Lecture 3

**Lemma 1.16.** Let  $p \geq 3$  and  $A \subset \mathbb{F}_p^n$  of density  $\alpha > 0$  be such that

$$\sup_{t \neq 0} |\hat{1}_A(t)| = o(1).$$

Then A contains  $(\alpha^3 + o(1))(p^n)^2$  3-term arithmetic progressions (3-APs).

In other words, a set with small Fourier coefficients has the same number of 3–APs as a truly random set of the same density.

**Notation.** Given  $f,g,h:\mathbb{F}_p^n\to\mathbb{C},\,T_3(f,g,h)=\mathbb{E}_{x,d}f(x)g(x+d)h(x+2d).$  Given  $A\subset\mathbb{F}_p^n,$  write  $2\cdot A=\{2a\mid a\in A\}.$  This is different from  $2A=A+A=\{a+a'\mid a,a'\in A\}.$ 

*Proof.* The number of 3-APs in A is  $(p^n)^2$  times  $T_3(1_A, 1_A, 1_A)$ , where

$$T_{3}(1_{A}, 1_{A}, 1_{A}) = \mathbb{E}_{x,d} 1_{A}(x) 1_{A}(x+d) 1_{A}(x+2d)$$

$$= \mathbb{E}_{x,y} 1_{A}(x) 1_{A}(y) 1_{A}(2y-x) \qquad y = x+d$$

$$= \mathbb{E}_{y} 1_{A}(y) (1_{A} * 1_{A}) (2y)$$

$$= \langle 1_{2 \cdot A}, 1_{A} * 1_{A} \rangle \qquad z = 2y$$

$$= \langle \widehat{1_{2 \cdot A}}, \widehat{1_{A} * 1_{A}} \rangle. \qquad \text{by Plancherel.}$$

Continue the last manipulation to get

$$\begin{split} &= \langle \widehat{\mathbf{1}_{2 \cdot A}}, \widehat{\mathbf{1}}_A^2 \rangle \\ &= \alpha^3 + \sum_{t \neq 0} \widehat{\mathbf{1}_A}(t)^2 \overline{\widehat{\mathbf{1}_{2 \cdot A}}(t)}. \end{split}$$

The last sum in absolute value is at most

$$\leq \sup_{t \neq 0} |\widehat{1_A}(t)| \sum_{t \neq 0} |\widehat{1_A}(t) \widehat{1_{2 \cdot A}(t)}|$$

$$\leq \sup_{t \neq 0} |\widehat{1_A}(t)| \left( \sum_t |\widehat{1_A}(t)|^2 \right)^{1/2} \left( \sum_t |\widehat{1_{2 \cdot A}}(t)|^2 \right)^{1/2}$$

$$\leq \sup_{t \neq 0} |\widehat{1_A}(t)| \cdot \alpha^{1/2} \cdot \alpha^{1/2}$$

$$\leq \sup_{t \neq 0} |\widehat{1_A}(t)|$$

$$\leq \sup_{t \neq 0} |\widehat{1_A}(t)|$$

by C-S and Parseval.

Using the above two results, we prove:

**Theorem 1.17** (Meshulam's Theorem). Let  $p \geq 3$  and let  $A \subset \mathbb{F}_p^n$  be a set containing no non-trivial 3-APs. Then  $|A| = O\left(\frac{p^n}{n \log p}\right)$ .

*Proof.* By assumption,  $T_3(1_A, 1_A, 1_A) = \frac{\alpha}{p^n}$ , but as in Lemma 1.16,

$$T_3(1_A, 1_A, 1_A) = \alpha^3 + \sum_{t \neq 0} \hat{1}_A(t)^2 \overline{\hat{1}_{2 \cdot A}(t)},$$

so  $\left|\frac{\alpha}{p^n} - \alpha^3\right| \leq \sup_{t \neq 0} |\hat{1}_A(t)| \cdot \alpha$ , which gives  $\sup_{t \neq 0} |\hat{1}_A(t)| \geq \left|\frac{1}{p^n} - \alpha^2\right| \geq \frac{\alpha^2}{2}$  provided  $p^n \geq 2\alpha^{-2}$ . By Lemma 1.15 with  $\rho = \frac{\alpha}{2}$ ,  $\exists V \leq \mathbb{F}_p^n$  of codimension 1 and  $x \in \mathbb{F}_p^n$  such that  $|A \cap (x+V)| \geq \left(\alpha + \frac{\alpha^2}{4}\right) |V|$ .

We iterate this observation. Let  $A_0=A, V_0=\mathbb{F}_p^n, \ \alpha_0=\alpha=\frac{|A_0|}{|V_0|}$ . At step i of this iteration, we are given a set  $A_{i-1}\subset V_{i-1}$  of density  $\alpha_{i-1}$  with no nontrivial 3–APs. Provided that  $p^{\dim(V_{i-1})}\geq 2\alpha_{i-1}^{-2},\ \exists V_i\leq V_{i-1}$  of codimension 1 and  $x_i\in V_{i-1}$  such that  $|A_{i-1}\cap(x_i+V_i)|\geq \left(\alpha_{i-1}+\frac{\alpha_{i-1}^2}{4}\right)|V_i|$ . Set  $A_i=A_{i-1}-x$ . Note  $\alpha_i\geq \alpha_{i-1}+\frac{\alpha_{i-1}^2}{4}$  and  $A_i$  is free of nontrivial 3–APs. Through this iteration, the density of A increases from  $\alpha$  to  $2\alpha$  in at most  $\frac{\alpha}{\alpha^2/4}=4\alpha^{-1}$  steps, from  $2\alpha$  to  $4\alpha$  in at most  $\frac{2\alpha}{(2\alpha)^2/4}=2\alpha^{-1}$  steps, etc, which reaches 1 in at most

$$(4\alpha^{-1} + 2\alpha^{-1} + \alpha^{-1} + \ldots) = 8\alpha^{-1}$$

steps. The argument must therefore end with  $\dim(V_i) \geq n - 8\alpha^{-1}$ , at which point we must have had  $p^{\dim(V_i)} \leq 2\alpha_i^{-2} \leq 2\alpha^{-2}$  (or else we could have continued). But we may assume that  $\alpha \geq \sqrt{2}p^{-n/4}$  (else we're done), whence  $p^{n-8\alpha^{-1}} \leq p^{n/2}$ , i.e.  $\frac{n}{2} \leq 8\alpha^{-1}$ , so  $\alpha \leq \frac{16}{n}$ , finishing the proof (in fact, we can now take  $C = 16 \log p$  as an explicit constant in the big O notation).

26 Jan 2024, Lecture 4

So for  $A \subset \mathbb{F}_3^n$  containing no nontrivial 3–APs, we have  $|A| = O\left(\frac{3^n}{n}\right)$ . The largest known subset of  $\mathbb{F}_3^n$  containing no notrivial 3–APs has size  $\geq (2.218)^n$ . (Proving  $2^n$  is trivial: take all combinations of zeroes and ones with no twos).

From now on, let G be a finite abelian group. G comes equipped with a set of **characters**, i.e. group homomorphisms  $\gamma: G \to \mathbb{C}^{\times}$ , which themselves form a group, denoted by  $\hat{G}$ , often referred to as the **dual** of G. It turns out that if G is finite and abelian, then  $\hat{G} \cong G$ . For instance:

- If  $G = \mathbb{F}_n^n$ , then  $\hat{G} = \{ \gamma_t : x \mapsto \omega^{x \cdot t} \mid t \in G \}$ .
- If  $G = \mathbb{Z}_p := \mathbb{Z}/p\mathbb{Z}$ , then  $\hat{G} = \{ \gamma_t : x \mapsto \omega^{xt} \mid t \in G \}$ .

**Definition 1.18.** Given  $f: G \to \mathbb{C}$ , define its **Fourier transform**  $\hat{f}: \hat{G} \to \mathbb{C}$  by

$$\hat{f}(\gamma) = \mathbb{E}_{x \in G} f(x) \gamma(x) \ \forall \gamma \in \hat{G}.$$

It is easy to verify that we have an inversion formula, given by

$$f(x) = \sum_{\gamma \in \hat{G}} \hat{f}(\gamma) \overline{\gamma(x)}.$$

We can also check that Definition 1.6 and 1.9, Examples 1.3 and 1.10 and Lemmas 1.5, 1.8 and 1.11 go through in this general context.

**Example 1.19.** Let p be a prime, let  $L \leq p-1$  be even and consider  $J = \left[-\frac{L}{2}, \frac{L}{2}\right] \subset \mathbb{Z}_p$ . Then  $\forall t \neq 0$ ,

$$|\hat{1}_J(t)| \le \min\left\{\frac{L+1}{p}, \frac{1}{2|t|}\right\}.$$

This is on Ex. Sheet 1.

**Theorem 1.20** (Roth's Theorem). Let  $A \subset [N] := \{1, 2, \dots, N\}$  be a set containing no non–trivial 3–APs. Then  $|A| = O\left(\frac{N}{\log\log N}\right)$ .

**Lemma 1.21.** Let  $A \subset [N]$  be of density  $\alpha > 0$  satisfying  $N > 50\alpha^{-2}$  containing no nontrivial 3-APs. Let p be a prime in  $\left[\frac{N}{3}, \frac{2N}{3}\right]$  and write  $A' = A \cap [p] \subset \mathbb{Z}_p$ . Then either

(i)  $\sup_{t\neq 0} |\hat{1}_{A'}(t)| \geq \frac{\alpha^2}{10}$  (where the Fourier coefficient is computed in  $\mathbb{Z}_p$ ); or

(ii)  $\exists$  interval  $J \subset [N]$  of length  $\geq \frac{N}{3}$  such that  $|A \cap J| \geq \alpha \left(1 + \frac{\alpha}{400}\right) |J|$ .

*Proof.* We may assume that  $|A'| = |A \cap [p]| \ge \alpha \left(1 - \frac{\alpha}{200}\right) p$ , since otherwise  $|A \cap [p+1,N]| \ge \alpha N - \alpha \left(1 - \frac{\alpha}{200}\right) p = \alpha (N-p) + \frac{\alpha^2 p}{200} \ge \alpha \left(1 + \frac{\alpha}{400}\right) (N-p)$ , so case (ii) holds with J = [p+1,N].

Let  $A'' = A' \cap \left[\frac{p}{3}, \frac{2p}{3}\right]$ . Note that all 3–APs of the form  $(x, x + d, x + 2d) \in A' \times A'' \times A''$  are in fact proper APs in [N] (and not only in  $\mathbb{Z}_p$ , since there's no "wrapping around", since  $x + d, x + 2d \in \left[\frac{p}{3}, \frac{2p}{3}\right]$ ).

If  $|A' \cap [p/3]|$  or  $|A' \cap [2p/3, p]|$  are at least  $\frac{2|A'|}{5}$ , then we are again in case (ii) (details left as exercise). Hence we may assume that  $|A''| \ge \frac{|A'|}{5}$ . Now as in Lemma 1.16 and Theorem 1.17 with  $\alpha' = |A'|/p$ ,  $\alpha'' = |A''|/p$ ,

$$\frac{\alpha''}{p} = \frac{|A''|}{p^2} = T_3(1_{A'}, 1_{A''}, 1_{A''}) = \alpha' \cdot \alpha''^2 + \sum_{t \neq 0} \hat{1}_{A'}(t) \hat{1}_{A''}(t) \overline{\hat{1}}_{2 \cdot A''}(t),$$

so as before,

$$\left| \frac{\alpha''}{p} - \alpha' \alpha''^2 \right| \le \frac{\alpha' \cdot \alpha''^2}{2} \le \sup_{t \ne 0} |\hat{1}_{A'}(t)| \cdot \alpha''$$

$$\implies \sup |\hat{1}_{A'}(t)| \ge \frac{\alpha' \cdot \alpha''}{2} \ge \frac{(\alpha')^2}{10}$$

provided that  $\frac{\alpha''}{p} \leq \frac{\alpha'(\alpha'')^2}{2}$  which holds since (using  $p \geq \frac{N}{3}$  and  $N > 50\alpha^{-2}$ )

$$\alpha'\alpha''p \geq \alpha'\alpha''\frac{N}{3} > \frac{\alpha'}{\alpha}\frac{\alpha''}{\alpha} \cdot 50 \geq \left(\frac{\alpha'}{\alpha}\right)^2 \cdot 10 = \left(1 - \frac{\alpha}{200}\right)^2 \cdot 10 \geq \frac{1}{2},$$

where the last step holds for  $\alpha = 1$  and hence for any  $\alpha \leq 1$ .

29 Nov 2024, Lecture 5

We first now convert the large Fourier coefficient into a density increment.

**Lemma 1.22.** Let  $m \in \mathbb{N}$  and let  $\phi : [m] \to \mathbb{Z}_p$  by  $x \mapsto xt$  for some nonzero t. Given  $\epsilon > 0$ , there exists a partition of [m] into progressions  $P_i$  of length  $\in [\epsilon \sqrt{m}/2, \epsilon \sqrt{m}]$  such that  $\operatorname{diam}(\phi(P_i)) = \max_{x,y \in P_i} |\phi(x) - \phi(y)| \le \epsilon p \ \forall i$ .

Proof. Set  $u = \lfloor \sqrt{m} \rfloor$  and consider  $0, t, 2t, \ldots, ut$ . By pigeonhole, we can find  $0 \le v < w \le u$  such that  $|wt - vt| \le \frac{p}{u}$ . Divide [m] into residue classes mod s, where s = w - v (so  $|st| \le \frac{p}{u}$ ). Each of these has size at least  $\frac{m}{s} \ge \frac{m}{u}$ . But each residue class can be divided into progressions of the form a, a + s, a + 2s, a + ds with  $\frac{\epsilon u}{2} < d \le \epsilon u$ . The diameter of the image of each progression under  $\phi$  is  $|dst| \le \epsilon p$ .

**Lemma 1.23.** Let  $A \subset [N]$  be of density  $\alpha > 0$ . Let p be a prime in  $\left[\frac{N}{3}, \frac{2N}{3}\right]$  and write  $A' = A \cap [p]$  as a subset of  $\mathbb{Z}_p$ . Suppose  $\exists t \neq 0$  such that  $\left|\widehat{1_A'}(t)\right| \geq \frac{\alpha^2}{10}$ .

Then there exists a progression P of length at least  $\frac{\alpha^2 \sqrt{N}}{500}$  such that  $|A \cap P| \ge \alpha \left(1 + \frac{\alpha}{80}\right) |P|$ .

*Proof.* Let  $\epsilon = \frac{\alpha^2}{40\pi}$  and use Lemma 1.22 to partition [p] into progressions  $P_i$  of length at least  $\frac{\epsilon\sqrt{p}}{2} \geq \frac{\alpha^2}{40\pi}\sqrt{\frac{N}{3}} \cdot \frac{1}{2} \geq \alpha^2\sqrt{N} \cdot \frac{1}{500}$  and  $\operatorname{diam}(\phi(P_i)) \leq \epsilon p$ . Fix one  $x_i$  from each  $P_i$ . Now work with the balanced function: since  $t \neq 0$ , the Fourier coefficient at t is the same for the indicator function and the balanced function.

$$\frac{\alpha^2}{10} \le \left| \widehat{f_{A'}}(t) \right| = \frac{1}{p} \left| \sum_{x \in \mathbb{Z}_p} f_{A'}(x) \omega^{xt} \right| = \frac{1}{p} \left| \sum_{i} \sum_{x \in P_i} f_{A'}(x) \omega^{xt} \right|$$

$$= \frac{1}{p} \left| \sum_{i} \sum_{x \in P_i} f_{A'}(x) \omega^{x_i t} + \sum_{i} \sum_{x \in P_i} f_{A'}(x) \left( \omega^{xt} - \omega^{x_i t} \right) \right|$$

$$\le \frac{1}{p} \sum_{i} \left| \sum_{x \in P_i} f_{A'}(x) \right| + \frac{1}{p} \sum_{i} \sum_{x \in P_i} |f_{A'}(x)| 2\pi\epsilon$$

$$\le \frac{1}{p} \sum_{i} \left| \sum_{x \in P_i} f_{A'}(x) \right| + \frac{\alpha^2}{20}$$

since  $|t(x_i - x)| \le \epsilon p \ \forall x \in P_i$ . Hence

$$\left| \frac{1}{p} \sum_{i} \left| \sum_{x \in P_{i}} f_{A'}(x) \right| \ge \frac{\alpha^{2}}{20}.$$

Since  $f_{A'}$  has mean zero,

$$\sum_{i} \left( \left| \sum_{x \in P_i} f_{A'}(x) \right| + \sum_{x \in P_i} f_{A'}(x) \right) \ge \frac{\alpha^2 p}{20},$$

so  $\exists i$  such that  $\left|\sum_{x\in P_i} f_{A'}(x)\right| + \sum_{x\in P_i} f_{A'}(x) \ge \frac{a^2|P_i|}{40}$  and so

$$\sum_{x \in P_i} f_{A'}(x) \ge \frac{\alpha^2 |P_i|}{80}.$$

This is about as technical as we get in this course.

Proof of Roth's Theorem, theorem 1.20. This is on Ex. Sheet 1.  $\Box$ 

**Example 1.24** (Behrend's example). There exists a set  $A \subset [N]$  containing no nontrivial 3-APs of size  $|A| \ge C \exp\left(-c\sqrt{\log N}\right) N$ , where c and C are absolute constants. This is again on Ex. Sheet 1.

**Definition 1.25.** Let  $\Gamma \subset \widehat{G}$  and  $\rho > 0$ . By the **Bohr set**, written  $B(\Gamma, \rho)$ , we mean

$$B(\Gamma, \rho) = \{ x \in G \mid |\gamma(x) - 1| \le \rho \ \forall \gamma \in \Gamma \}.$$

We call  $|\Gamma|$  the **rank** and  $\rho$  the **radius** of the Bohr set.

**Example 1.26.** When  $G = \mathbb{F}_p^n$  and p = 3, we have  $B(\Gamma, \rho) = \langle \Gamma \rangle^{\perp} \ \forall \rho < 1$  (draw a picture!). For larger p, the same holds for smaller  $\rho$ .

**Lemma 1.27.** Let  $\Gamma \subset \widehat{G}$  be of size d and let  $\rho > 0$ . Then  $|B(\Gamma, \rho)| \geq \left(\frac{\rho}{2\pi}\right)^d |G|$ .

Proof. This is on Ex. Sheet 2.

**Lemma 1.28** (Bogolyubov's lemma, again). Given  $A \subset \mathbb{Z}_p$  of density  $\alpha > 0$ ,  $\exists \Gamma \subset \widehat{\mathbb{Z}}_p$  of size at most  $2\alpha^{-2}$  such that  $B\left(\Gamma, \frac{1}{2}\right) \subset A + A - A - A$ .

31 Jan 2024, Lecture 6

*Proof.* Recall  $1_A*1_A*1_{-A}*1_{-A}(x) = \sum_{t \in \widehat{Z_p}} \left| \widehat{1_A}(t) \right|^4 \omega^{-xt}$ . Let  $\Gamma = \operatorname{Spec}_{\sqrt{\frac{\alpha}{2}}}(1_A)$  and note that for all  $x \in B\left(\Gamma, \frac{1}{2}\right)$  and  $t \in \Gamma$ ,  $\cos(2\pi xt/p) > 0$ . Hence

$$\operatorname{Re}\left(\sum_{t\in\widehat{Z_p}}\left|\widehat{1_A}(t)\right|^4\omega^{-xt}\right) = \underbrace{\sum_{t\in\Gamma}\left|\widehat{1_A}(t)\right|^4\cos\left(2\pi xt/p\right)}_{\geq\alpha^4} + \underbrace{\sum_{t\not\in\Gamma}\left|\widehat{1_A}(t)\right|^4\cos(2\pi xt/p)}_{\text{in absolute value}} \le \sup_{t\not\in\Gamma}\left|\widehat{1_A}(t)\right|^2\sum\left|\widehat{1_A}(t)\right|^2 \le \left(\sqrt{\frac{\alpha}{2}}\cdot\alpha\right)^2\cdot\alpha = \frac{\alpha^4}{2}$$

#### 2 Combinatorial methods

For now, let G be an abelian group. Given  $A, B \subset G$ . We defined  $A + B = \{a + b \mid a \in A, b \in B\}$  and can define  $A - B = \{a - b \mid a \in A, b \in B\}$ . If A and B are finite, then

$$\max(|A|, |B|) < |A \pm B| < |A| |B|$$

(and better bounds are available in certain settings).

**Example 2.1.** Let  $V \leq \mathbb{F}_p^n$  be a subspace. Then V + V = V, so |V + V| = |V|. In fact, if  $A \subset \mathbb{F}_p^n$  is such that |A + A| = |A|, then A must be a coset of a subspace.

**Example 2.2.** Let  $A \subset \mathbb{F}_p^n$  be such that  $|A+A| < \frac{3}{2} |A|$ . Then  $\exists V \leq \mathbb{F}_p^n$  such that  $A \subset V$  and  $|V| < \frac{3}{2} |A|$ . This is on Ex. Sheet 2.

**Example 2.3.** Let  $A \subset \mathbb{F}_p^n$  be a set of linearly independent vectors. Then A+A has size  $\binom{|A|}{2}$ . However,  $|A| \leq n$ , which is a small set.

Let  $A \subset \mathbb{F}_p^n$  be a set chosen randomly with probability  $p^{-\theta n}$  with  $\theta \in \left(\frac{1}{2}, 1\right]$ . Then with high probability,  $|A + A| = (1 - o(1)) \frac{|A|^2}{2}$ .

**Definition 2.4.** Given finite sets  $A, B \subset G$ , we define the **Rusza distance** d(A, B) between A and B by

$$d(A,B) = \log \frac{|A - B|}{\sqrt{|A||B|}}.$$

Observe that d(A, B) is nonnegative and symmetric.

**Lemma 2.5** (Rusza's triangle inequality). Given finite sets A, B, C, we have

$$d(A,C) < d(A,B) + d(B,C).$$

*Proof.* Observe that  $|B||A-C| \leq |A-B||B-C|$ . Indeed, writing each  $d \in A-C$  as  $d=a_d-c_d$  for some  $a_d \in A, c_d \in C$ , the map

$$\phi: B \times (A - C) \to (A - B) \times (B - C)$$
$$(b, d) \mapsto (a_d - b) \times (b - c_d)$$

is injective (easy exercise). The triangle inequality now follows from the definition of the Rusza distance.  $\hfill\Box$ 

**Definition 2.6.** Given a finite set  $A \subset G$ , we write  $\sigma(A) = \frac{|A+A|}{|A|}$  for the doubling constant and  $\delta(A) = \frac{|A-A|}{|A|}$  for the difference constant.

Then by Lemma 2.5

$$\log \delta(A) = d(A, A) < d(A, -A) + d(A, -A) = 2 \log \sigma(A),$$

so 
$$\delta(A) \le \sigma(A)^2$$
, i.e.  $|A - A| \le \frac{|A + A|^2}{|A|}$ .

**Notation.** Given  $A \subset G$  and  $l, m \in \mathbb{Z}_{>0}$ , write lA - mA for the set

$$\underbrace{A+A+\ldots+A}_{l \text{ times}} - \underbrace{A-A-\ldots-A}_{m \text{ times}}.$$

**Theorem 2.7** (Plünnecke's inequality). Let  $A, B \subset G$  be finite sets such that  $|A + B| \leq K |A|$  for some K > 0. Then for any  $l, m \in \mathbb{Z}_{\geq 0}$ ,

$$|lB - mB| \le K^{l+m} |A|.$$

02 Feb 2024, Lecture 7 *Proof.* WLOG assume that  $|A+B|=K\,|A|$ . Choose a nonempty subset  $A'\subset A$  such that the ratio  $\frac{|A'+B|}{|A'|}$  is minimized, and call this ratio K'. Then  $|A'+B|=K'\,|A'|,\,K'\leq K$  and  $|A''+B|\geq K'\,|A''|\,\,\forall A''\subset A$ .

**Claim.** For any finite  $C \subset G$ ,  $|A' + B + C| \leq K' |A' + C|$ .

We first finish the proof assuming this claim, and then prove it. We first show that  $|A'+mB| \leq (K')^m |A| \ \forall m \in \mathbb{Z}_{\geq 0}$ . The cases m=0 and m=1 are clear. Now suppose that m>1 and the result holds for m-1. By the claim with C=(m-1)B,

$$|A' + mB| = |A' + B + (m-1)B| \le K' |A' + (m-1)B| \le K' \cdot (K')^{m-1} |A'|.$$

But as in the proof of Rusza's triangle inequality,

$$|A'| |lB - mB| \le |A' + lB| |A' + mB| \le (K')^l |A'| (K')^m |A'|$$
  
 $\implies |lB - mB| \le (K')^{l+m} |A'| \le K^{l+m} |A|.$ 

Finally, we prove the claim by induction on |C|. For |C| = 1, we are just translating sets, so the claim holds. Now suppose the claim holds for some |C| and consider  $C' = C \cup \{x\}$  for some  $x \notin C$ . Observe

$$A' + B + C' = (A' + B + C) \cup (A' + B + x)$$

and in fact

$$A' + B + C' = (A' + B + C) \cup (A' + B + x) \setminus (D + B + x)$$

where  $D = \{a \in A' \mid A' + B + x \subset A' + B + C\}$ . By the definition of K,  $|D + B| \ge K' |D|$ , so

$$|A' + B + C'| \le |A' + B + C| + |(A' + B + x) \setminus (D + B + x)|$$

$$\le |A' + B + C| + |A' + B| - |D + B|$$

$$\le K' |A' + C| + K' |A'| - K' |D|$$

$$= K'(|A' + C| + |A'| - |D|).$$

Now apply the same argument again for  $A'+C'=(A'+C)\sqcup((A'+x)\backslash(E+x))$ , where  $E=\{a\in A'\mid a+x\in A'+C\}\subset D$ . Notice that the union is disjoint in this case. We conclude that

$$|A' + C'| = |A' + C| + |A'| - |E| \ge |A' + C| + |A'| - |D|$$
  
$$\implies |A' + B + C'| \le K'(|A' + C| + |A'| - |D|) \le K'|A' + C'|,$$

proving the claim and hence the proof.

We are now in a position to generalize Example 2.2.

**Theorem 2.8** (Freiman–Rusza theorem). Let  $A \subset \mathbb{F}_p^n$  be such that  $|A+A| \leq K |A|$  (i.e.  $\sigma(A) = K$ ) for some K > 0. Then A is contained in a coset of a subspace  $H \leq \mathbb{F}_p^n$  of size  $|H| \leq K^2 p^{K^4} |A|$ .

*Proof.* Choose maximal  $X \subset 2A - A$  such that the translates x + A for  $x \in X$  are disjoint. X cannot be too large:  $\forall x \in X, x + A \subset 3A - A$  and by Plünnecke,  $|3A - A| \leq K^4 |A|$ . But the translates x + A for  $x \in X$  are isjoint and each of size |A|, so

$$|X| |A| = \left| \bigcup_{x \in X} (x + A) \right| \le |3A - A| \le K^4 |A|,$$

hence  $|X| \leq K^4$ . We next show that  $2A - A \stackrel{(\star)}{\subset} X + A - A$ . Indeed, if  $y \in 2A - A$  and  $y \notin X$ , then  $y + A \cap (x + A) \neq \emptyset$  for some  $x \in X$  by maximality of X, so  $y \in X + A - A$ . If  $y \in X$ , then trivially  $y \in X + A - A$ . It follows by induction from  $(\star)$  that for all  $l \geq 2$ ,

$$lA - A \stackrel{(\star\star)}{\subset} (l-1)X + A - A,$$

since using the induction hypothesis,

$$lA - A = A + (l-1)A - A \stackrel{\text{hyp}}{\subset} A + (l-2)X + A - A$$
$$= (l-2)X + 2A - A \stackrel{(\star)}{\subset} (l-2)X + X + (A-A) = (l-1)X + A - A.$$

Now let H be the subgroup of  $\mathbb{F}_p^n$  generated by A, which we can write in the form  $H = \bigcup_{l \geq 1} (lA - A) \overset{(\star\star)}{\subset} Y + A - A$ , where Y is the subgroup generated by X. Then  $|Y| \leq p^{|X|} \leq p^{K^4}$ , so

$$|H| \le |Y + A - A| |Y| |A - A| \le p^{K^4} K^2 |A|.$$
